Frequency dependent, single mode, 2D propagation

Frequency dependent, single mode, 2D propagation

Model for waves of virtual seismic sources:

$$\nabla^2 \mathbf{u}(\omega, \mathbf{x}) - \omega^2 \mathbf{s}^2(\omega, \mathbf{x}) \mathbf{u}(\omega, \mathbf{x}) = \mathbf{f}(\omega, \mathbf{x}) \quad (1)$$

$$\mathbf{x} = \begin{pmatrix} x \\ y \end{pmatrix}$$

$$\nabla^2 = \partial_x^2 + \partial_y^2$$

$\mathbf{s}^2(\omega, \mathbf{x})$: slowness

$\mathbf{u}^2(\omega, \mathbf{x})$: particle motion

$\mathbf{f}^2(\omega, \mathbf{x})$: source function

Table of contents

1 Single Frequency 2D FWI

2 Synthetic Examples

Observed data:

$$\mathbf{u}_{\text{obs}}(\omega, \mathbf{x}) \quad (2)$$

Choice of physical model:

$$\nabla^2 \mathbf{u}(\omega, \mathbf{x}) - \omega^2 \mathbf{s}^2(\omega, \mathbf{x}) \mathbf{u}(\omega, \mathbf{x}) = \mathbf{f}(\omega, \mathbf{x}) \quad (3)$$

Objective function (for a single frequency):

$$\mathbf{J}_{\text{FWI}}(\mathbf{s}) = \frac{1}{2} \left\| \mathbf{u}(\mathbf{s}) - \mathbf{u}_{\text{obs}} \right\|_2 \quad (4)$$

We want to find the $\mathbf{s}(\omega, \mathbf{x})$ that minimizes $\mathbf{J}_{\text{FWI}}(\mathbf{s})$:

Solved by linearization and optimized using conjugate gradients.

2 Synthetic Examples

Gaussian anomaly to retrieve

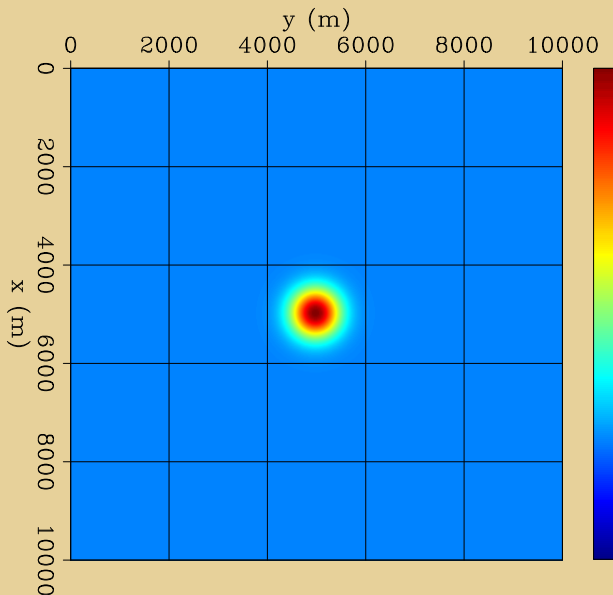

One source and one receiver - 2-Hz

One source and two receivers - 2-Hz

One source and a line of receivers - 2-Hz

One source and a field of receivers - 2-Hz

A line of sources and a line of receivers - 2-Hz

A line of sources and a field of receivers - 2-Hz

A square of sources and receivers - 2-Hz

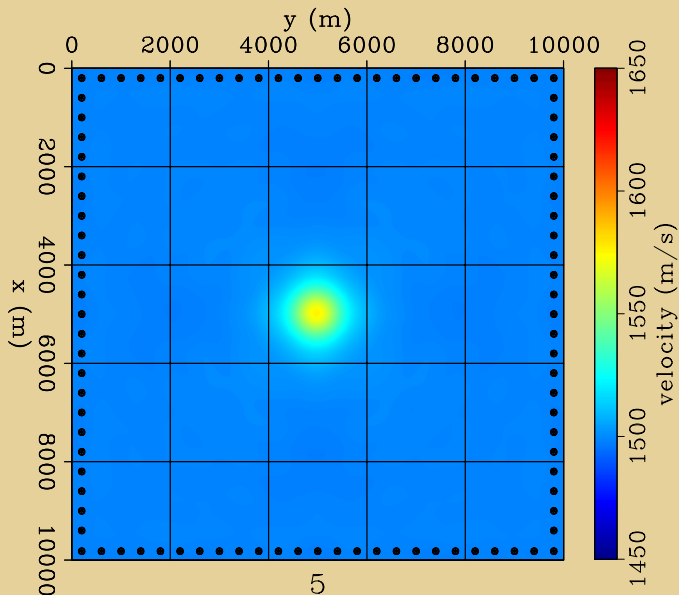

A square of sources and a field of receivers - 1-Hz

A square of sources and a field of receivers - 4-Hz

A square of sources and a field of receivers - 1-Hz

A square of sources and a field of receivers - 2-Hz

A square of sources and a field of receivers - 4-Hz

Gaussian anomaly to retrieve

- Illuminating a target from many different angles enables recovering the shape in single frequency FWI.
- Final image is limited by the wavelength of the source field.
- With stations limited to the surface, this approach is relevant for surface waves.

A square of sources and a field of receivers - 2-Hz
