Acknowledgement

1. Dr. Yi Luo from Saudi Aramco for discussions that lead to this project
2. Sponsors of SEP for the financial support

Outline

- ▶ **Motivation**
- ▶ **Theory**
- ▶ **Salt estimation**
- ▶ **Conclusion**

Troubleshooting philosophy

**“When you have eliminated the impossible, whatever remains, however improbable, must be the truth”
- Sherlock Holmes**

Ray based tomography

**“When you have eliminated the impossible, whatever remains, however improbable, must be the truth”
- Sherlock Holmes**

Repeat:

- 1. Tracing rays from all sources to receivers**
- 2. Measure traveltimes differences**
- 3. Distribute traveltimes differences evenly on the rays as gradient.**
- 4. Calculate step-length and update velocity model**

Ray based tomography troubleshooting

“When you have **eliminated the impossible, whatever remains, however improbable, must be the truth**”

- Sherlock Holmes

Repeat:

1. Tracing rays from all sources to receivers
2. **Measure traveltimes differences**
3. Distribute traveltimes differences evenly on the rays as gradient.
4. Calculate step-length and update velocity model

Wave-equation Traveltime Inversion(WTI)

“When you have eliminated the impossible, whatever remains, however improbable, must be the truth”

- Sherlock Holmes

Repeat:

- 1. Forward modeling of synthetic data**
- 2. Measure traveltime differences**
- 3. Reverse Time Migration of virtual source to form gradient.**
- 4. Calculate step-length and update velocity model**

WTI trouble shooting

“When you have **eliminated the impossible, whatever remains, however improbable, must be the truth**”

- Sherlock Holmes

Repeat:

1. Forward modeling of synthetic data
2. Measure traveltime differences
3. Reverse Time Migration of virtual source to form gradient.
4. Calculate step-length and update velocity model

Preferred WTI trouble shooting

“When you have **eliminated the impossible, whatever remains, however improbable, must be the truth**”

- Sherlock Holmes

Repeat:

1. Forward modeling of synthetic data
2. **Measure traveltimes differences**
3. Reverse Time Migration of virtual source to form gradient.
4. Calculate step-length and update velocity model

Motivation

Explore the possibility of WTI that's :

- **Given a reasonable starting model, the only failure of real data application comes from errors in traveltime difference measurements.**

Outline

- ▶ Motivation
- ▶ **Theory**
- ▶ Salt estimation
- ▶ Conclusion

Objective function

$$\min f(\mathbf{m}) = \sum_{\mathbf{x}_s, \mathbf{x}_r} \Delta\tau^2(\mathbf{m}, \mathbf{x}_s, \mathbf{x}_r)$$

(Luo and Schuster, 1991)

$\Delta\tau$

First break traveltimes difference between
observed data and modeled data

\mathbf{m}

Near surface model

$\mathbf{x}_s, \mathbf{x}_r$

Source, receiver location

Back propagation term

$$\delta d_{vsrc} = \Delta \tau \frac{\dot{d}_{obs}(t + \Delta \tau)}{\dot{d}_{obs}(t + \Delta \tau) * \dot{d}_{cal}(t)}$$

(Luo and Schuster, 1991)

δd_{vsrc} Back propagation term

\dot{d} Time derivative

$*$ Cross-correlation

Back propagation term

$$\delta d_{vsrc} = \Delta\tau \frac{\dot{d}_{obs}(t + \Delta\tau)}{\dot{d}_{obs}(t + \Delta\tau) * \dot{d}_{cal}(t)}$$

(Luo and Schuster, 1991)

Noise source #1

δd_{vsrc} Back propagation term

\dot{d} Time derivative

$*$ Cross-correlation

Back propagation term

$$\delta d_{vsrc} = \Delta \tau \frac{\dot{d}_{obs}(t + \Delta \tau)}{\dot{d}_{obs}(t + \Delta \tau) * \dot{d}_{cal}(t)}$$

(Luo and Schuster, 1991)

Noise source #2

δd_{vsrc} Back propagation term

\dot{d} Time derivative

$*$ Cross-correlation

Modified back propagation term

$$\delta d'_{vsrc} = \Delta \tau \frac{\dot{d}_{cal}(t)}{\dot{d}_{cal}(t) * \dot{d}_{cal}(t)} \quad \dot{d}_{obs}(t + \Delta \tau) \approx \dot{d}_{cal}(t)$$

δd_{vsrc} Back propagation term

\dot{d} Time derivative

$*$ Cross-correlation

Corresponding gradient

$$G = \Delta\tau G_w$$

Reverse Time Migration of

$$\frac{\dot{d}_{cal}(t)}{\dot{d}_{cal}(t) * \dot{d}_{cal}(t)}$$

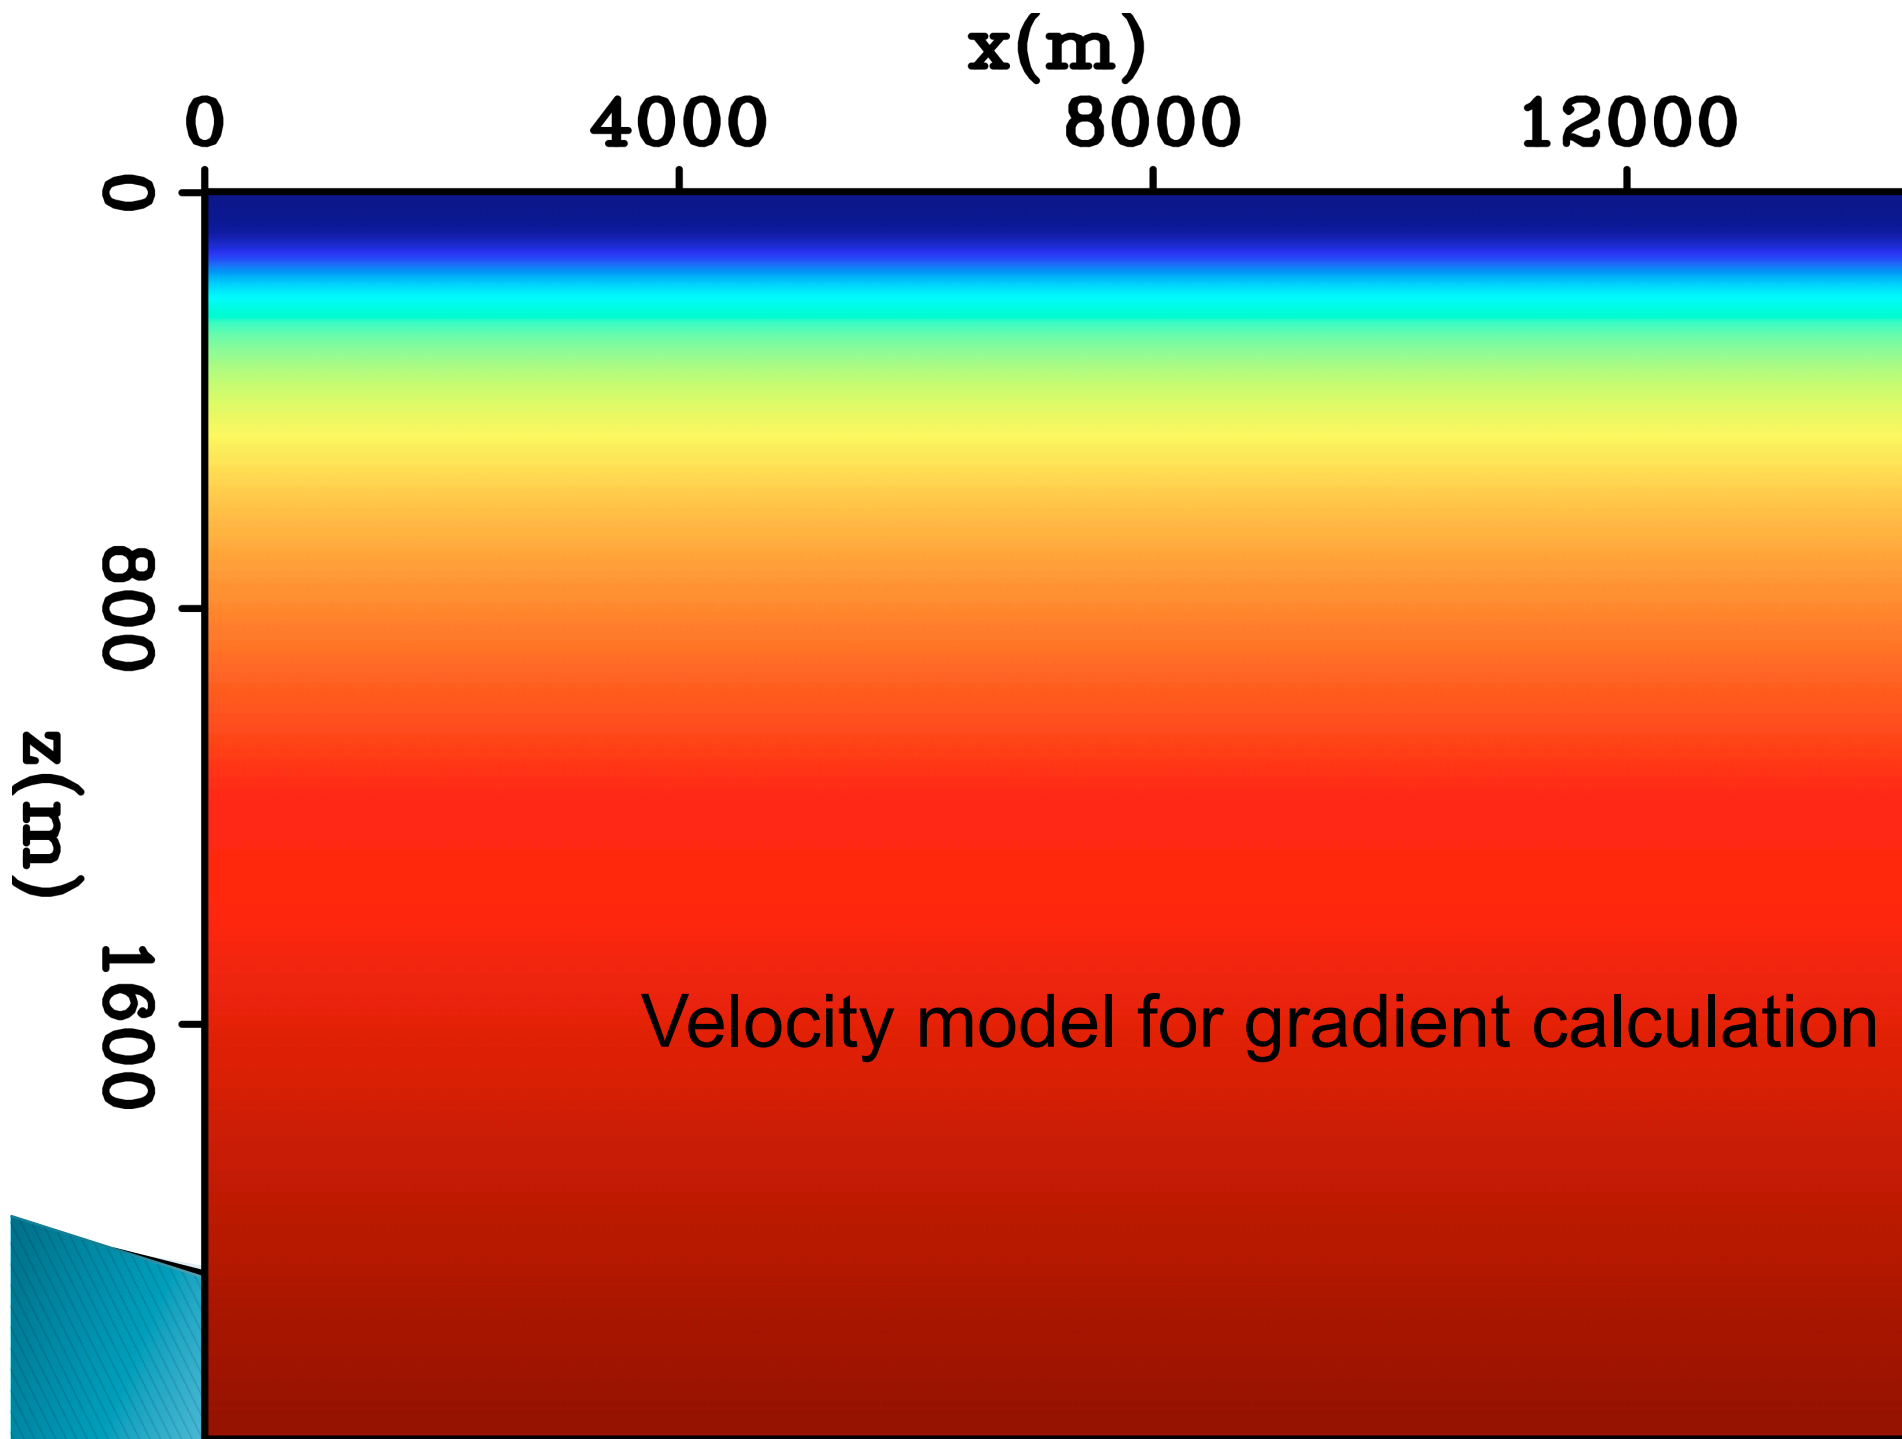

Corresponding gradient

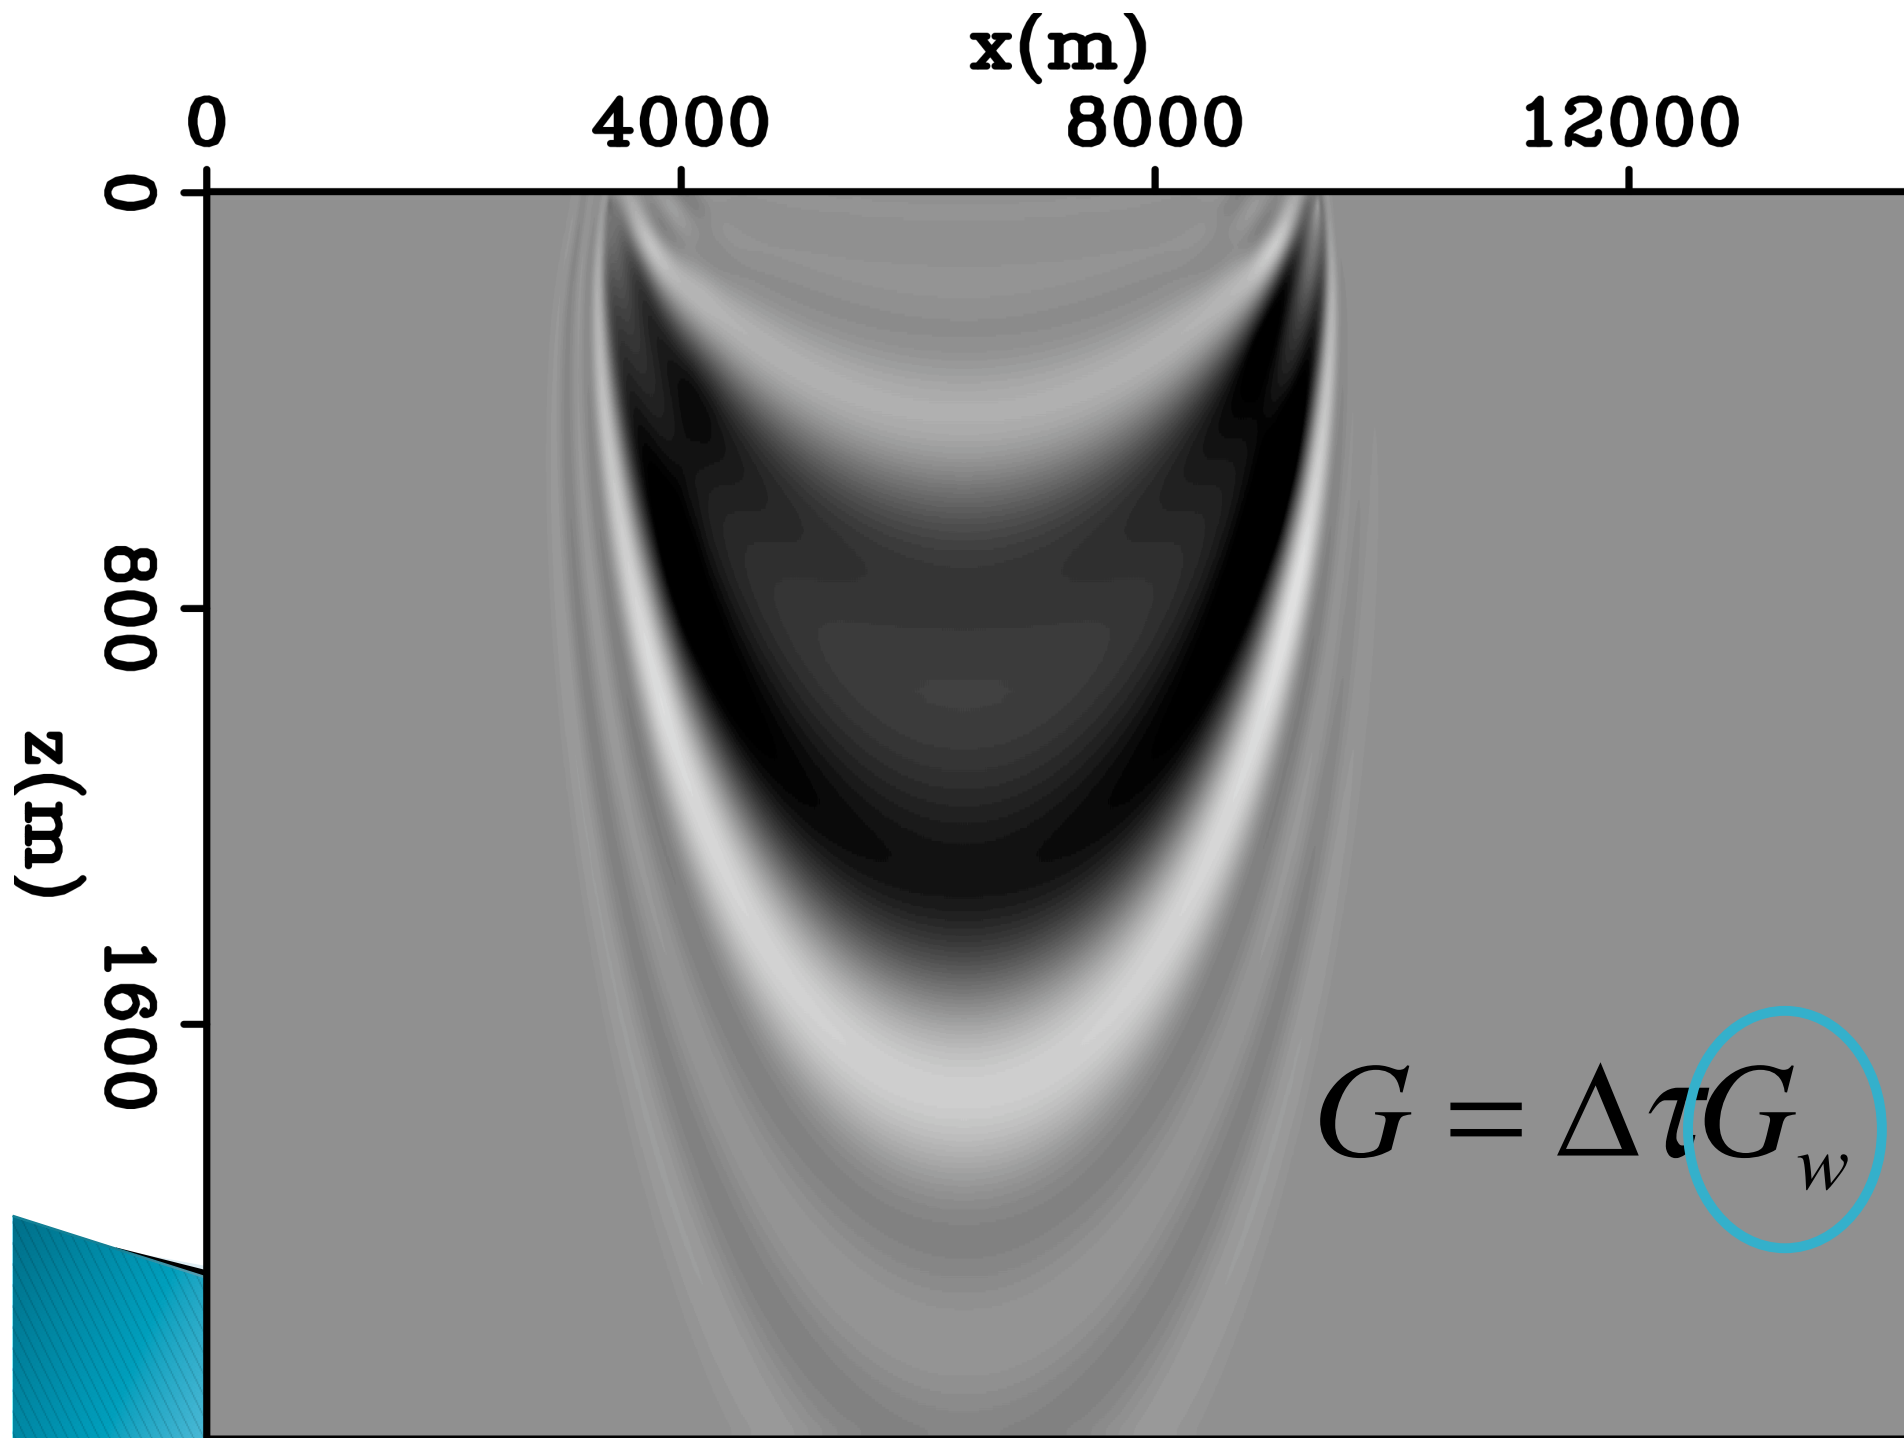

$$G = \Delta \tau G_w$$

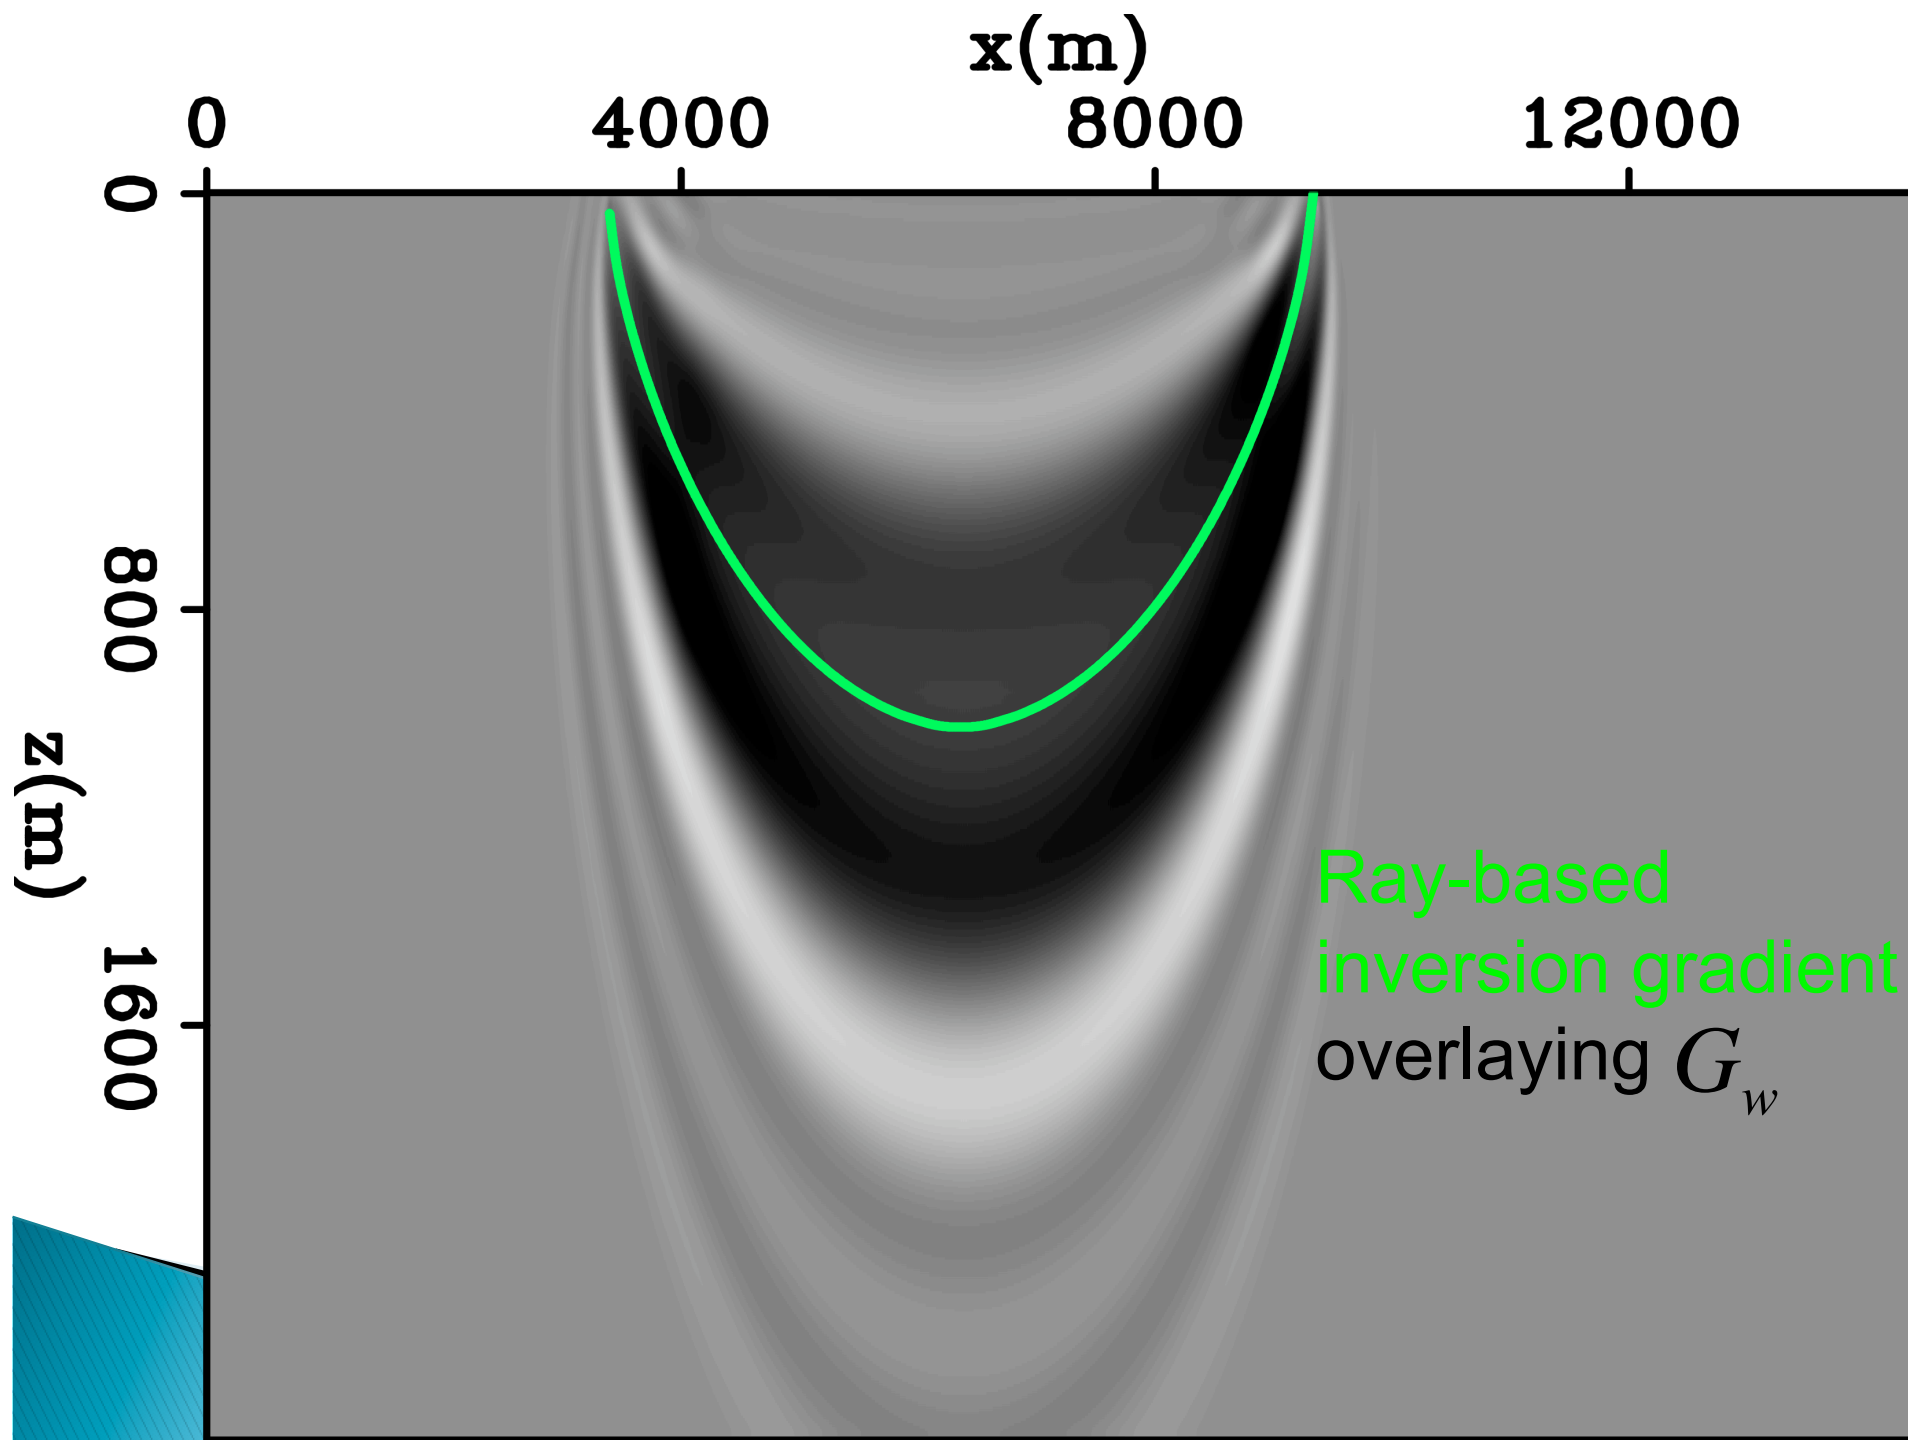

Reverse Time Migration of $\frac{\dot{d}_{cal}(t)}{\dot{d}_{cal}(t) * \dot{d}_{cal}(t)}$

Completely synthetic kernel

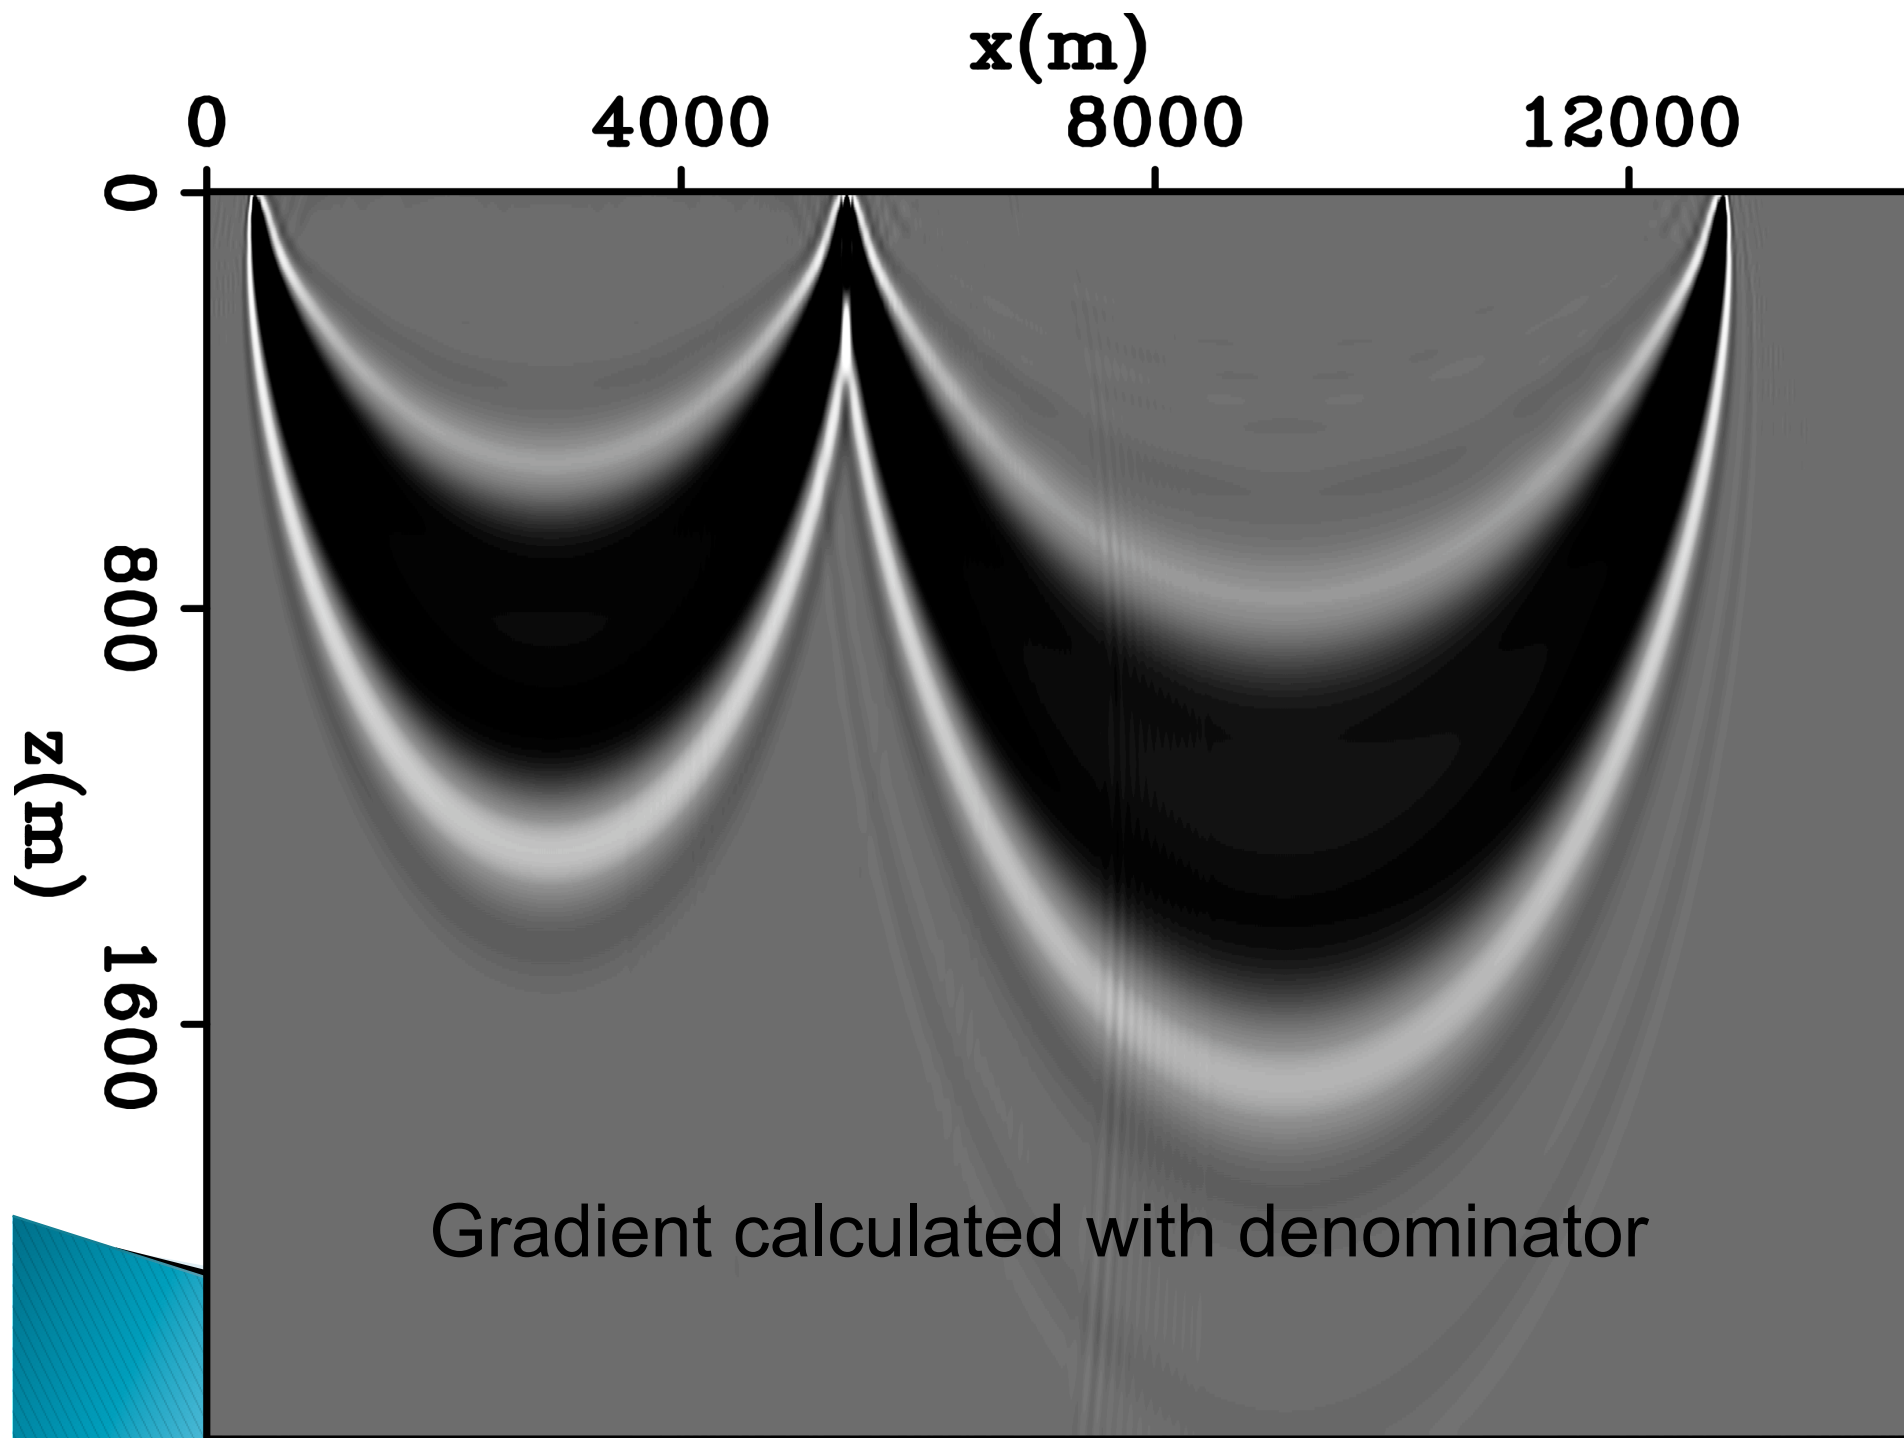

Purpose of the denominator

$$G_w = \text{Reverse Time Migration of } \frac{\dot{d}_{cal}(t)}{\dot{d}_{cal}(t) * \dot{d}_{cal}(t)}$$

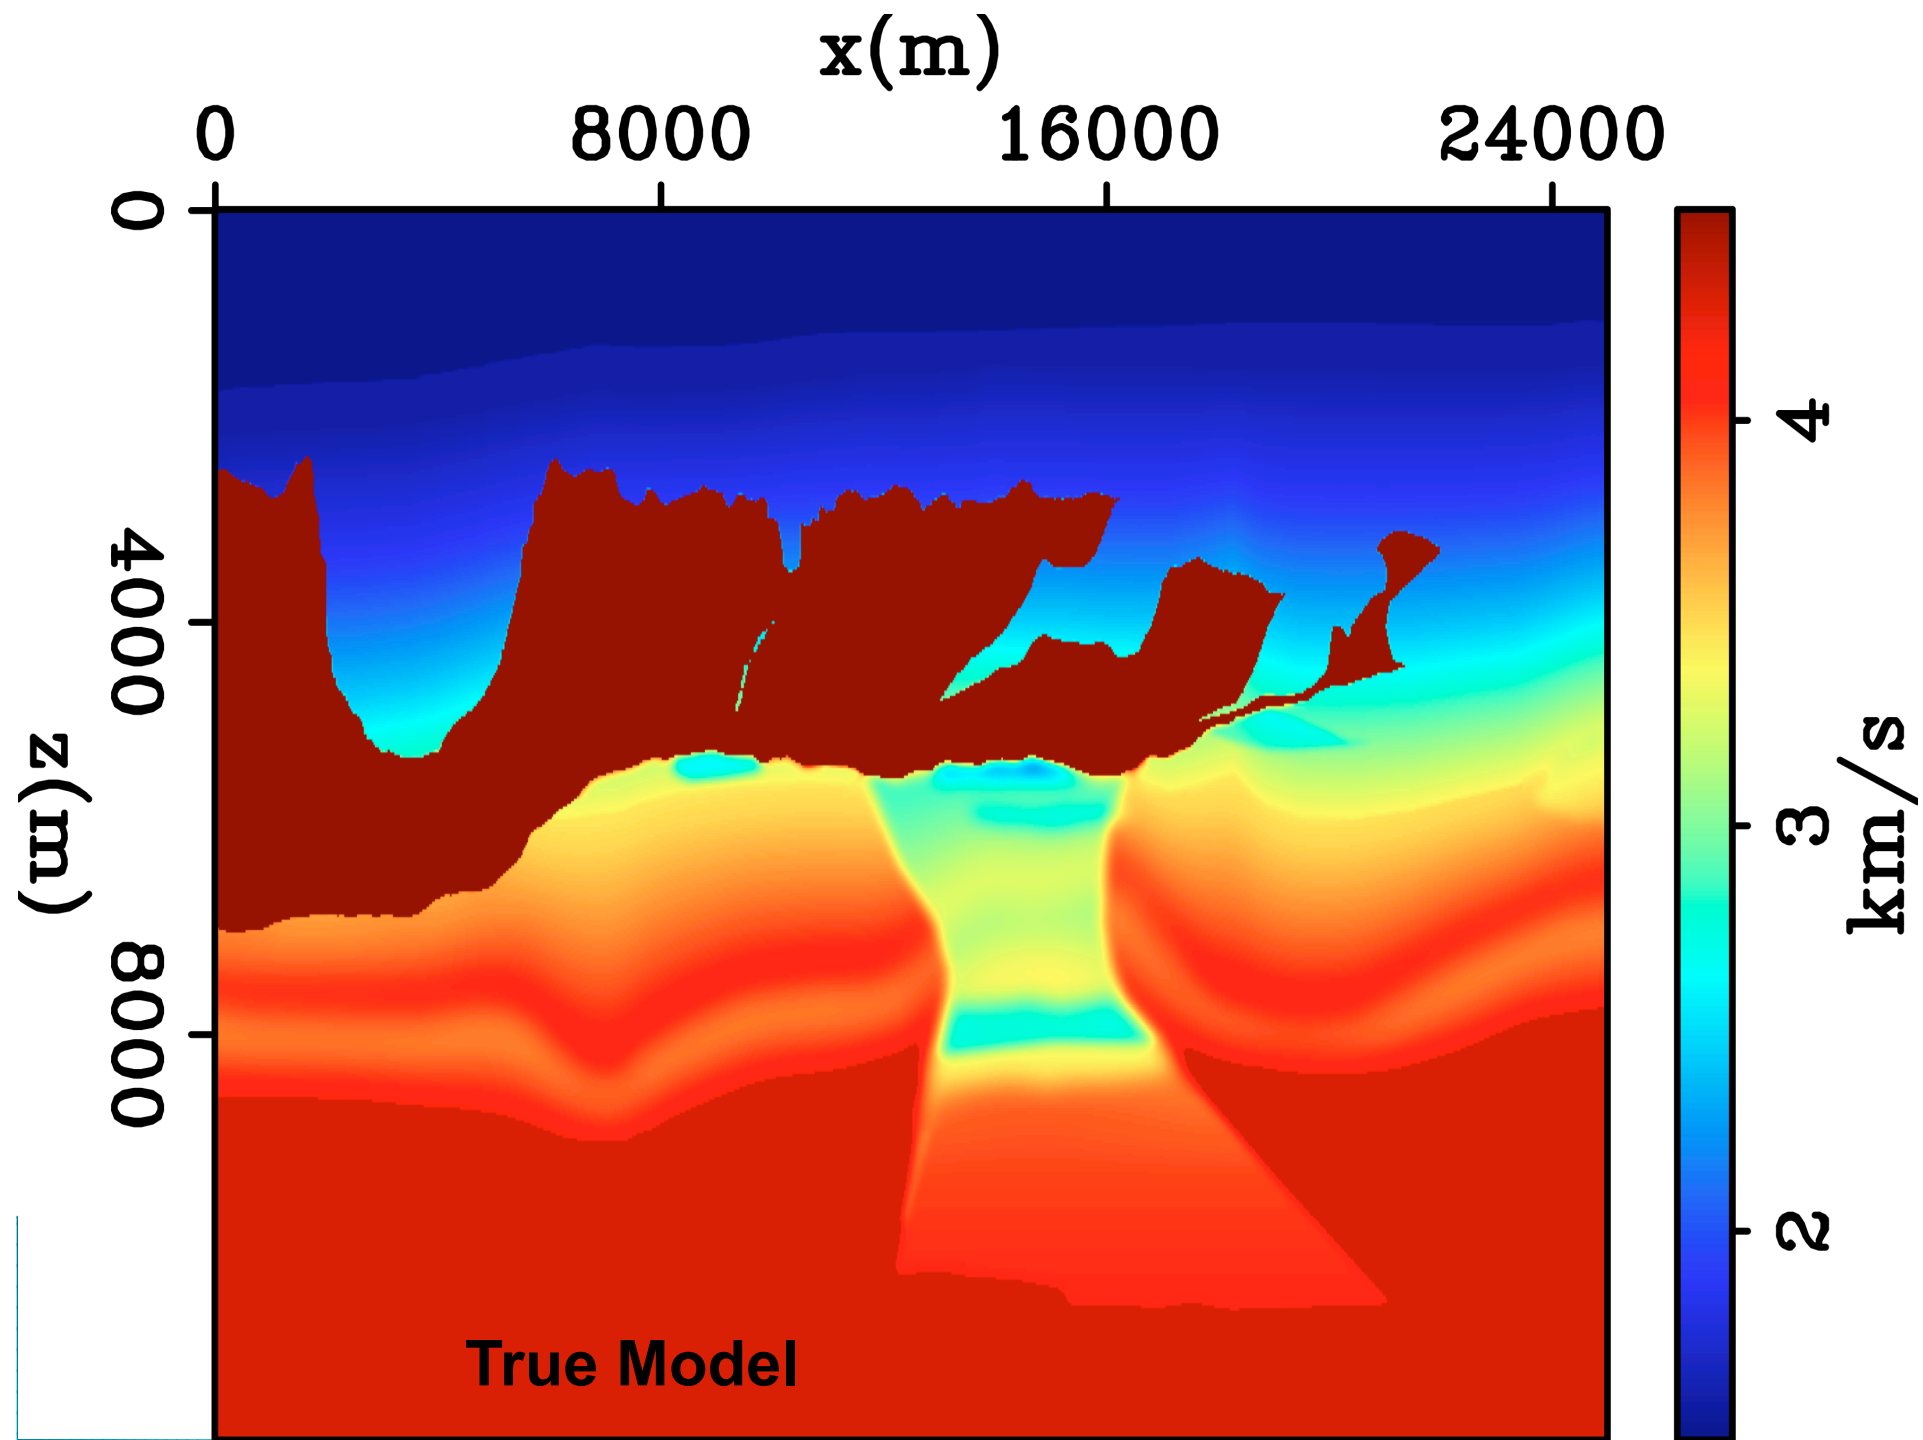

Outline

- ▶ Conclusion

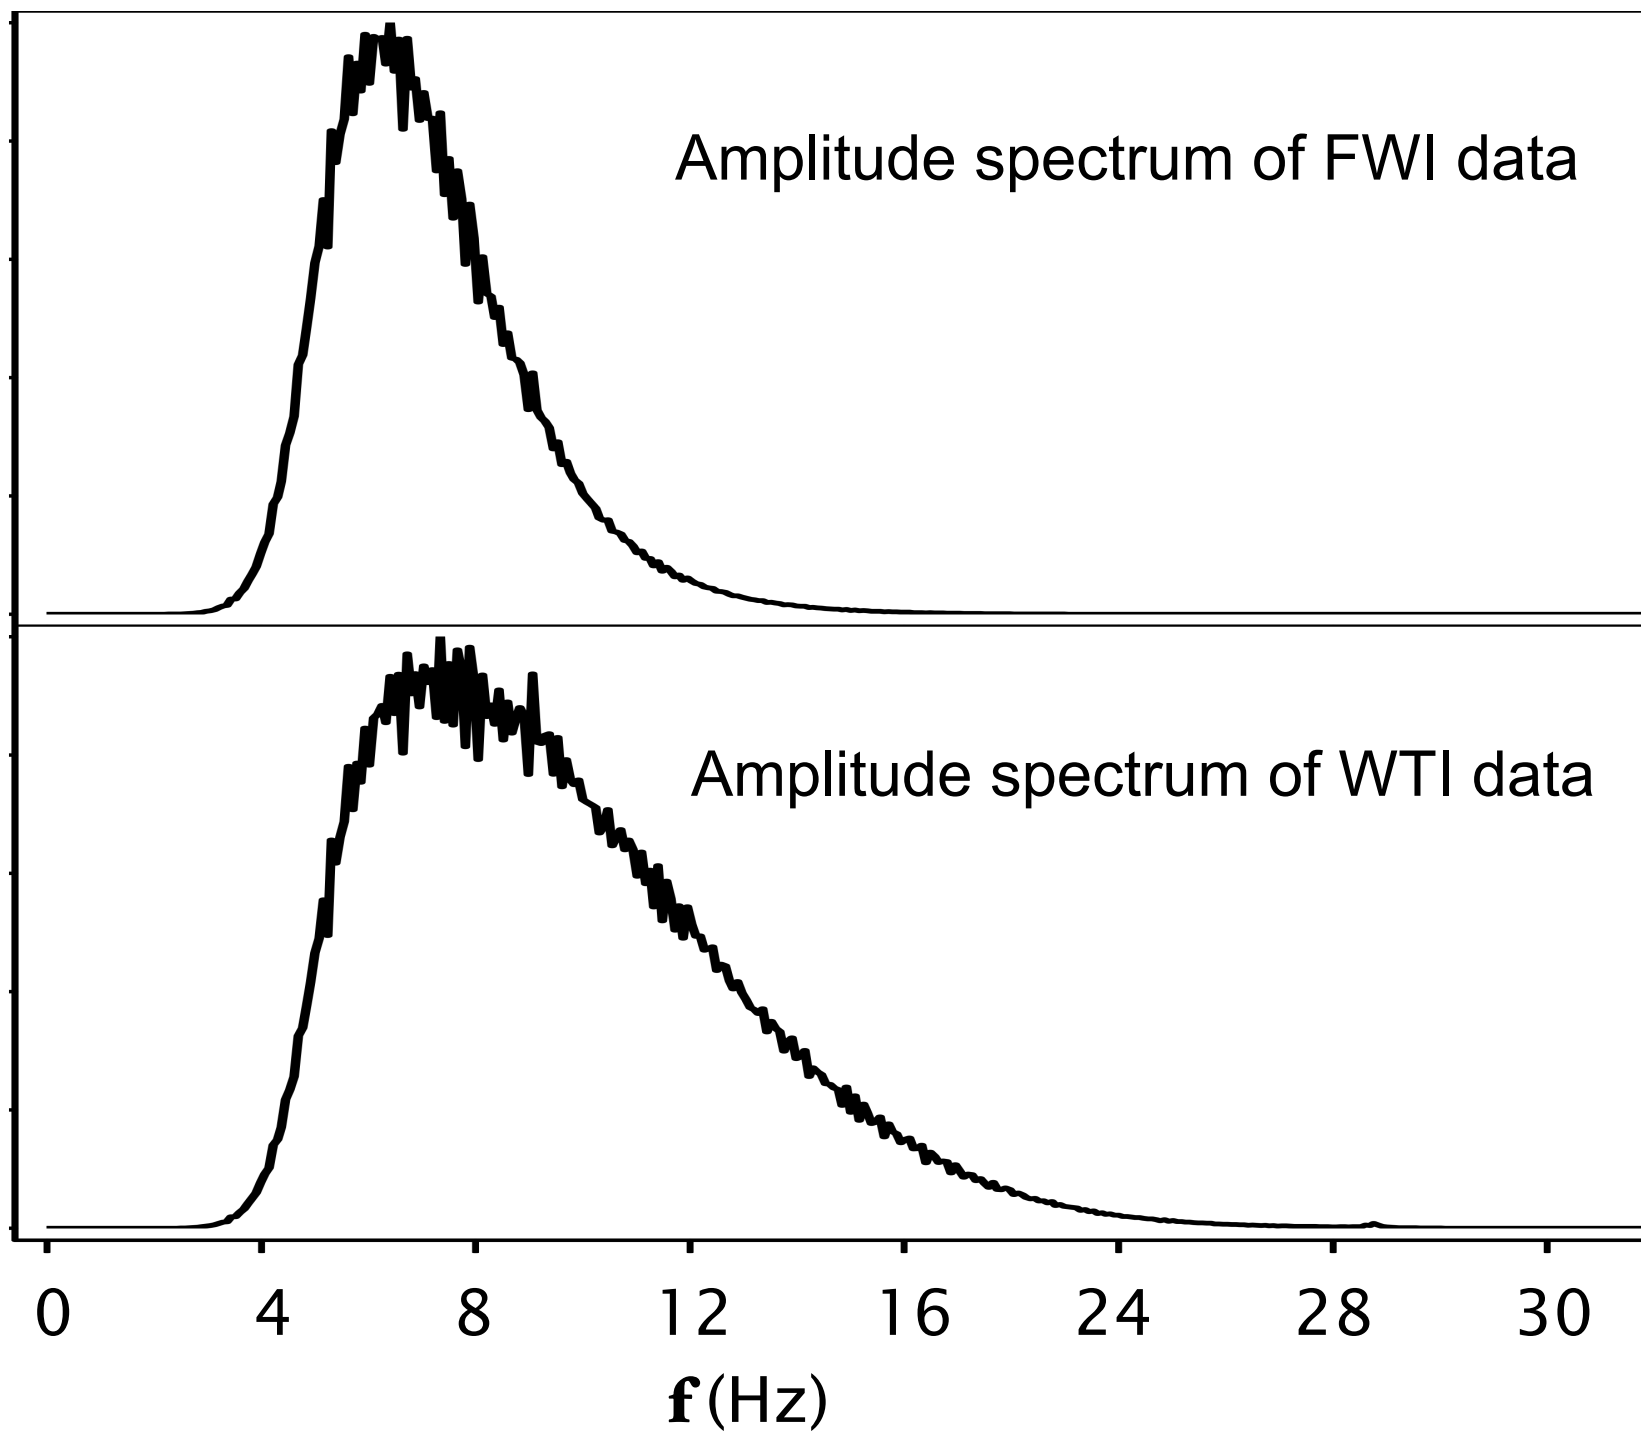

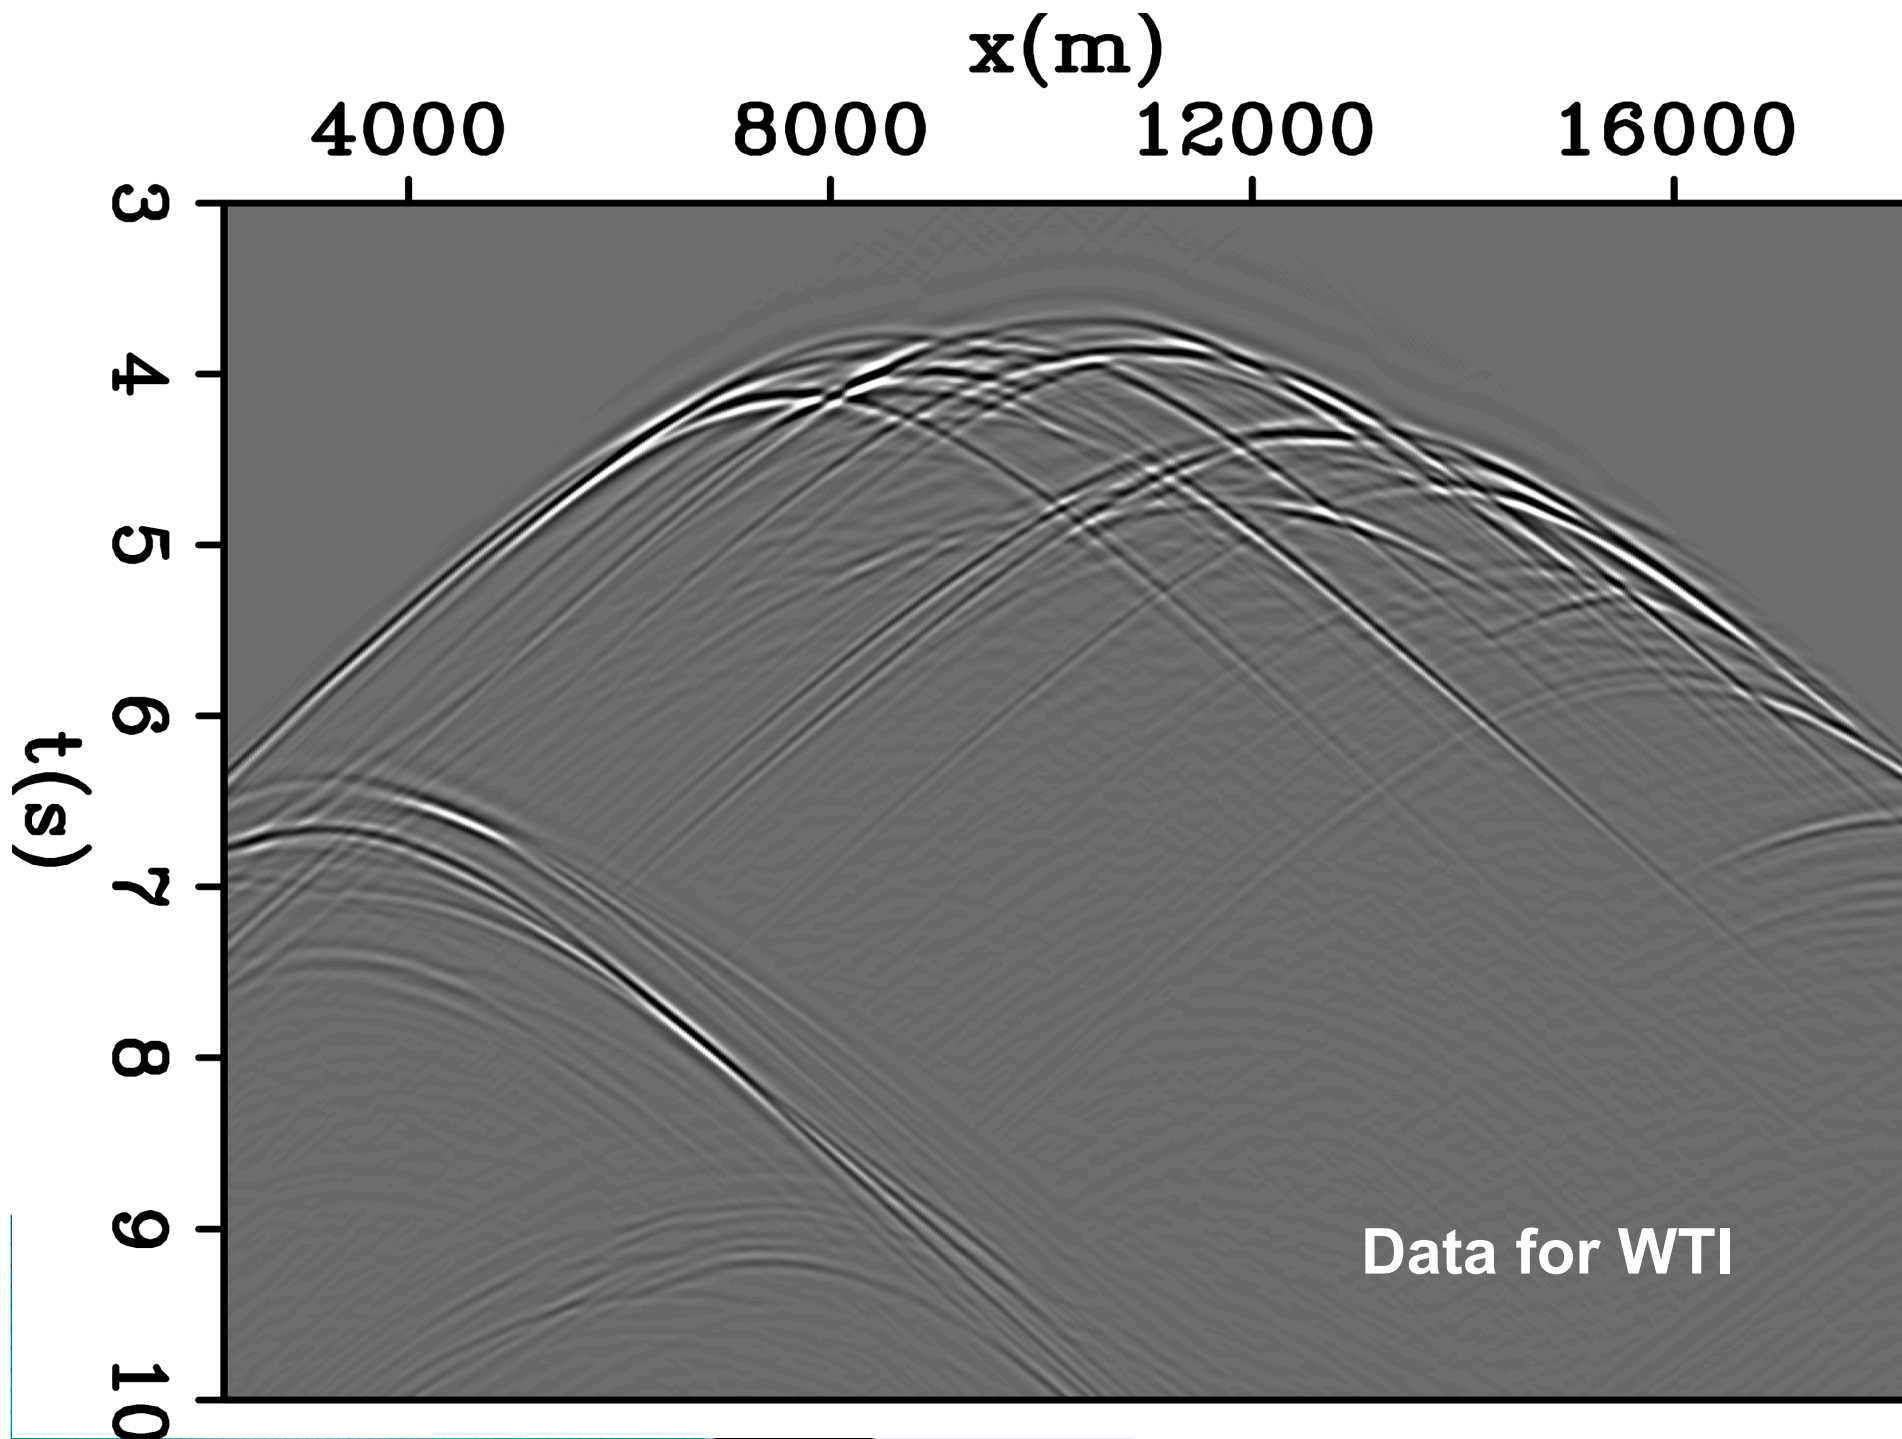

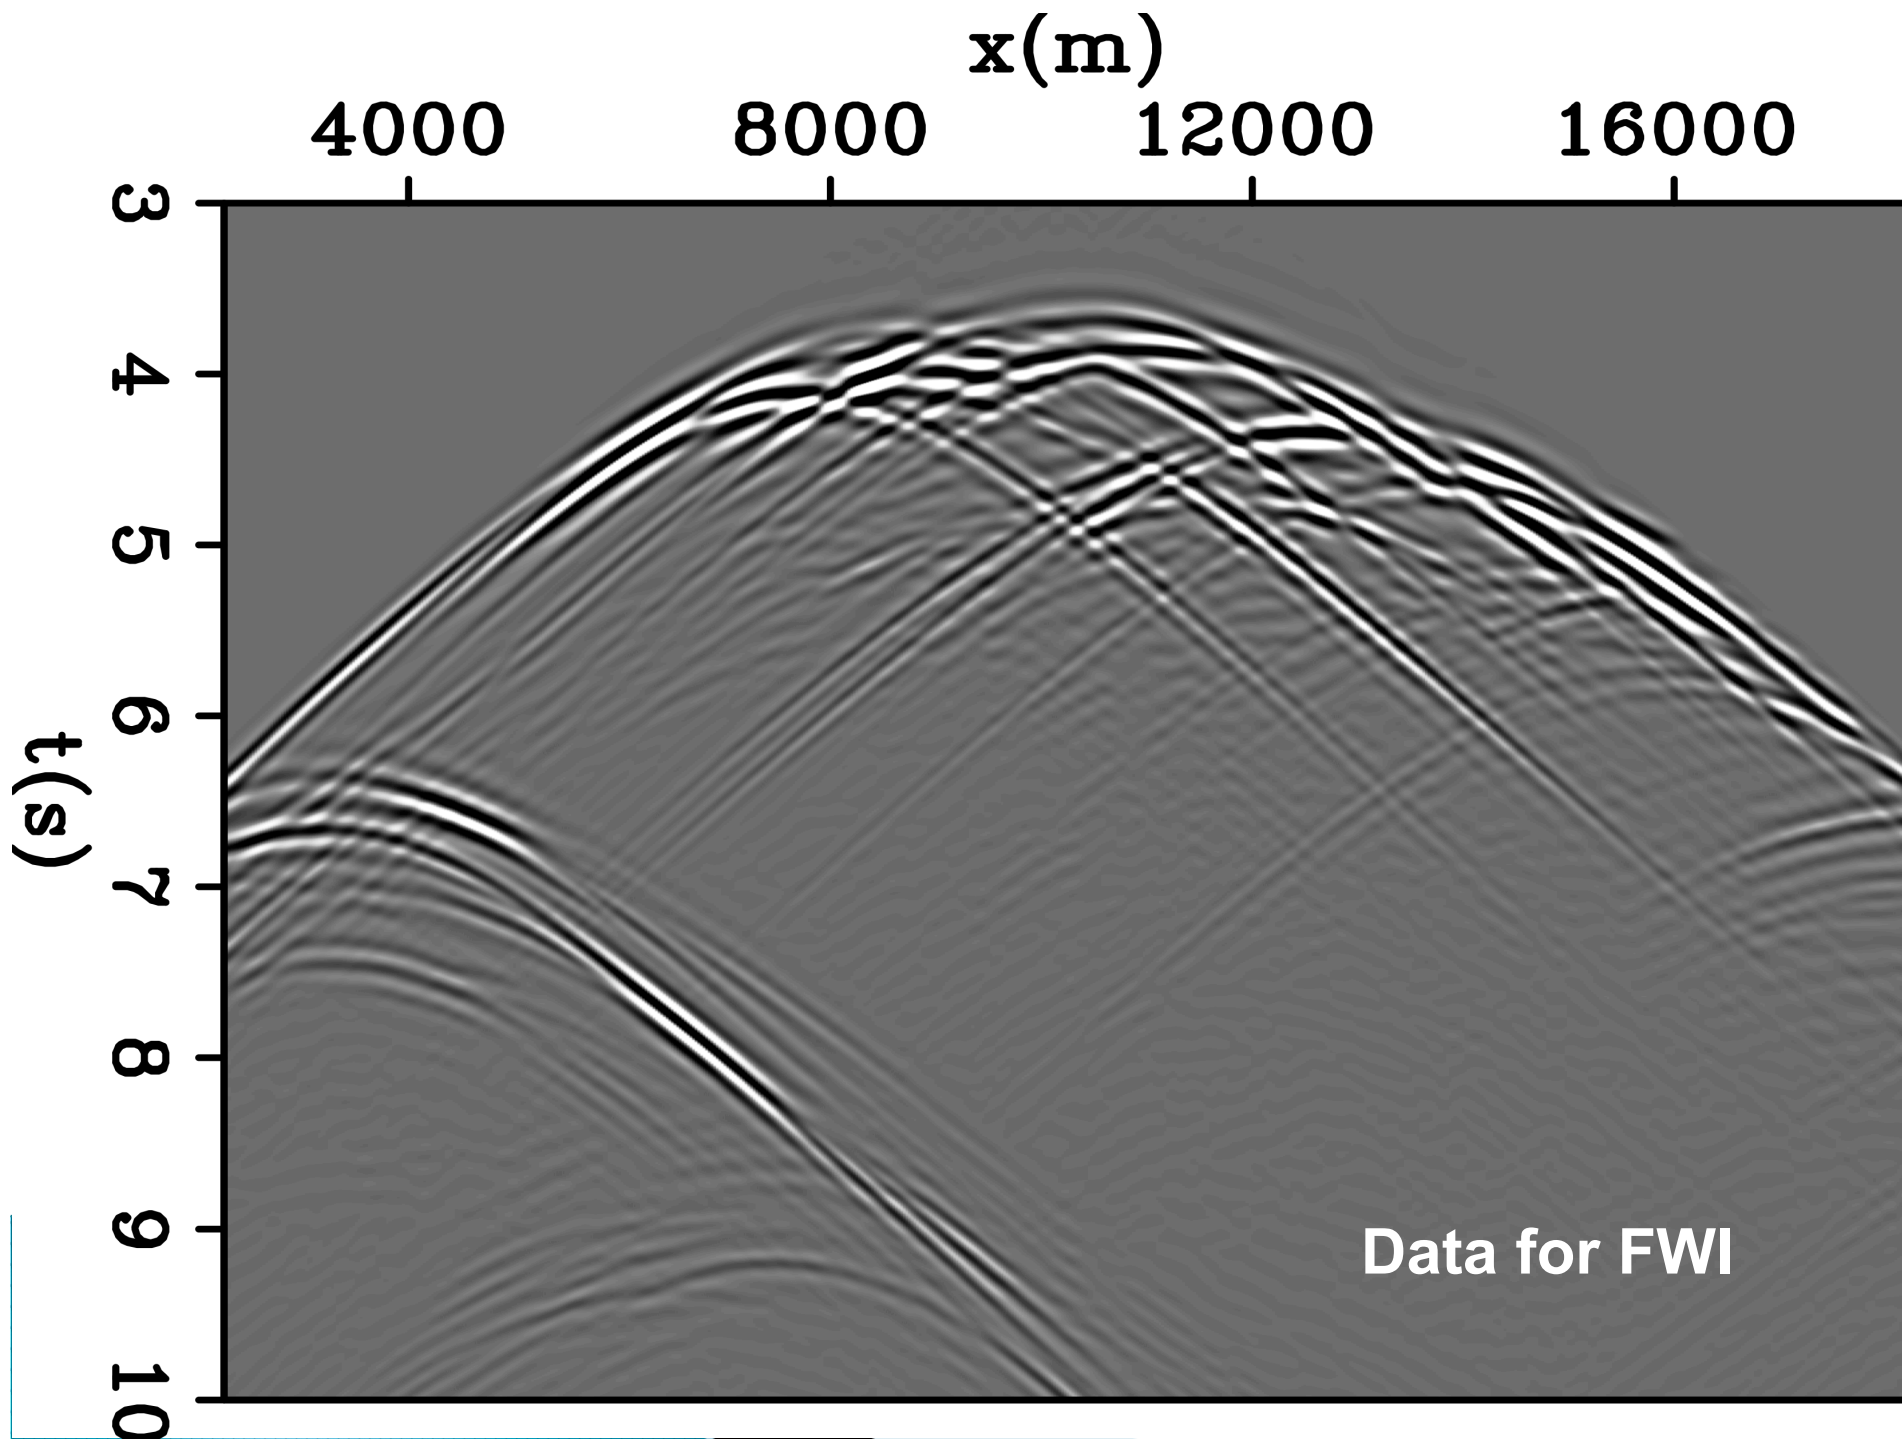

Survey Geometry

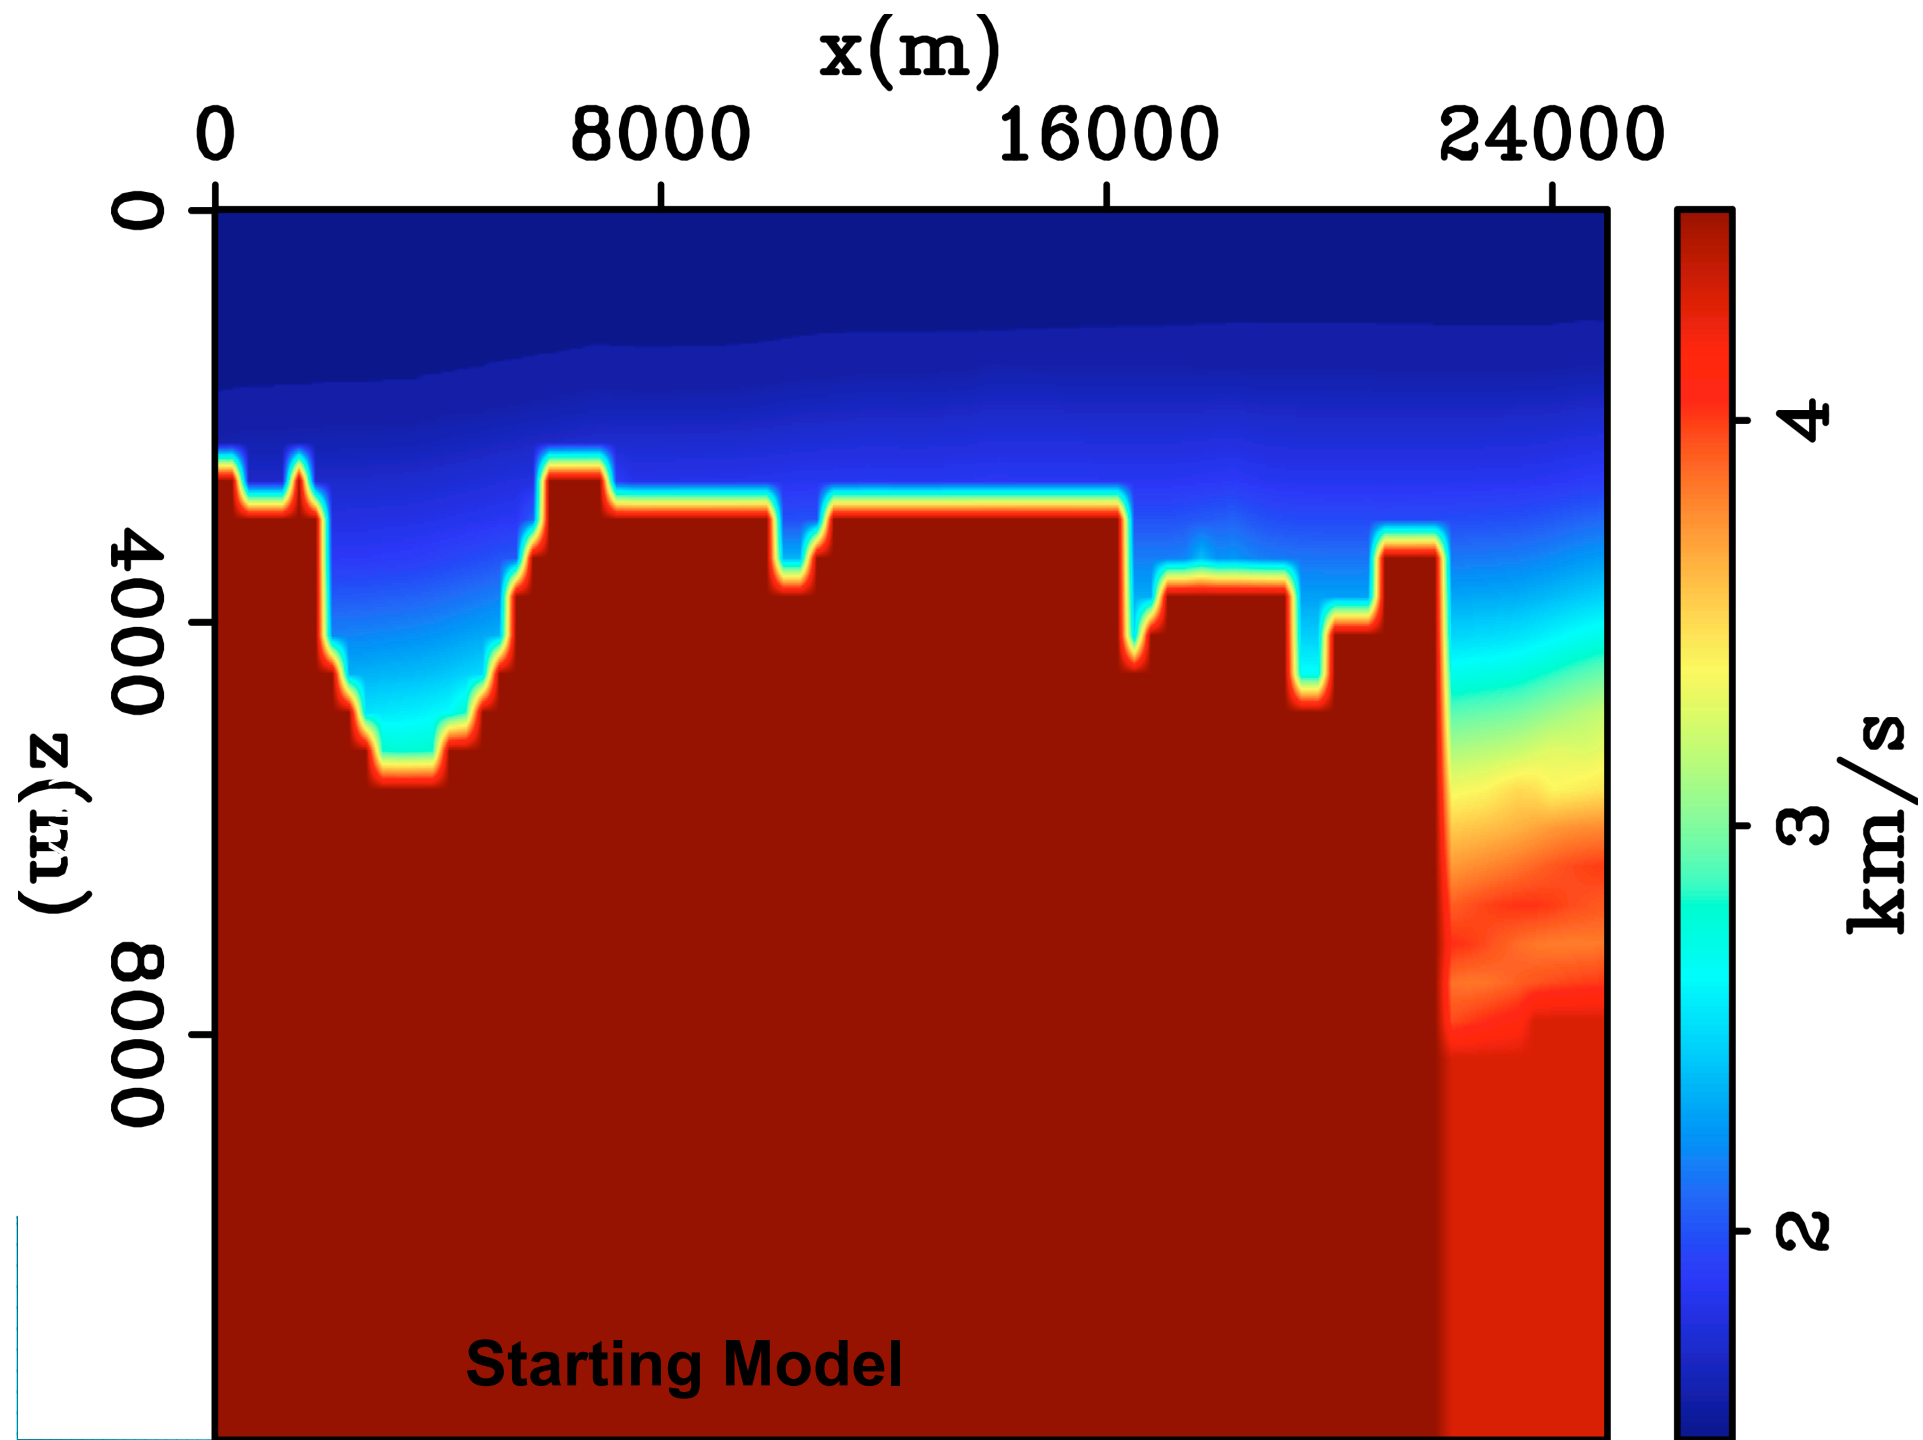

Shot number:	96
Shot spacing:	250m
Offset for each shot:	-8km~8km

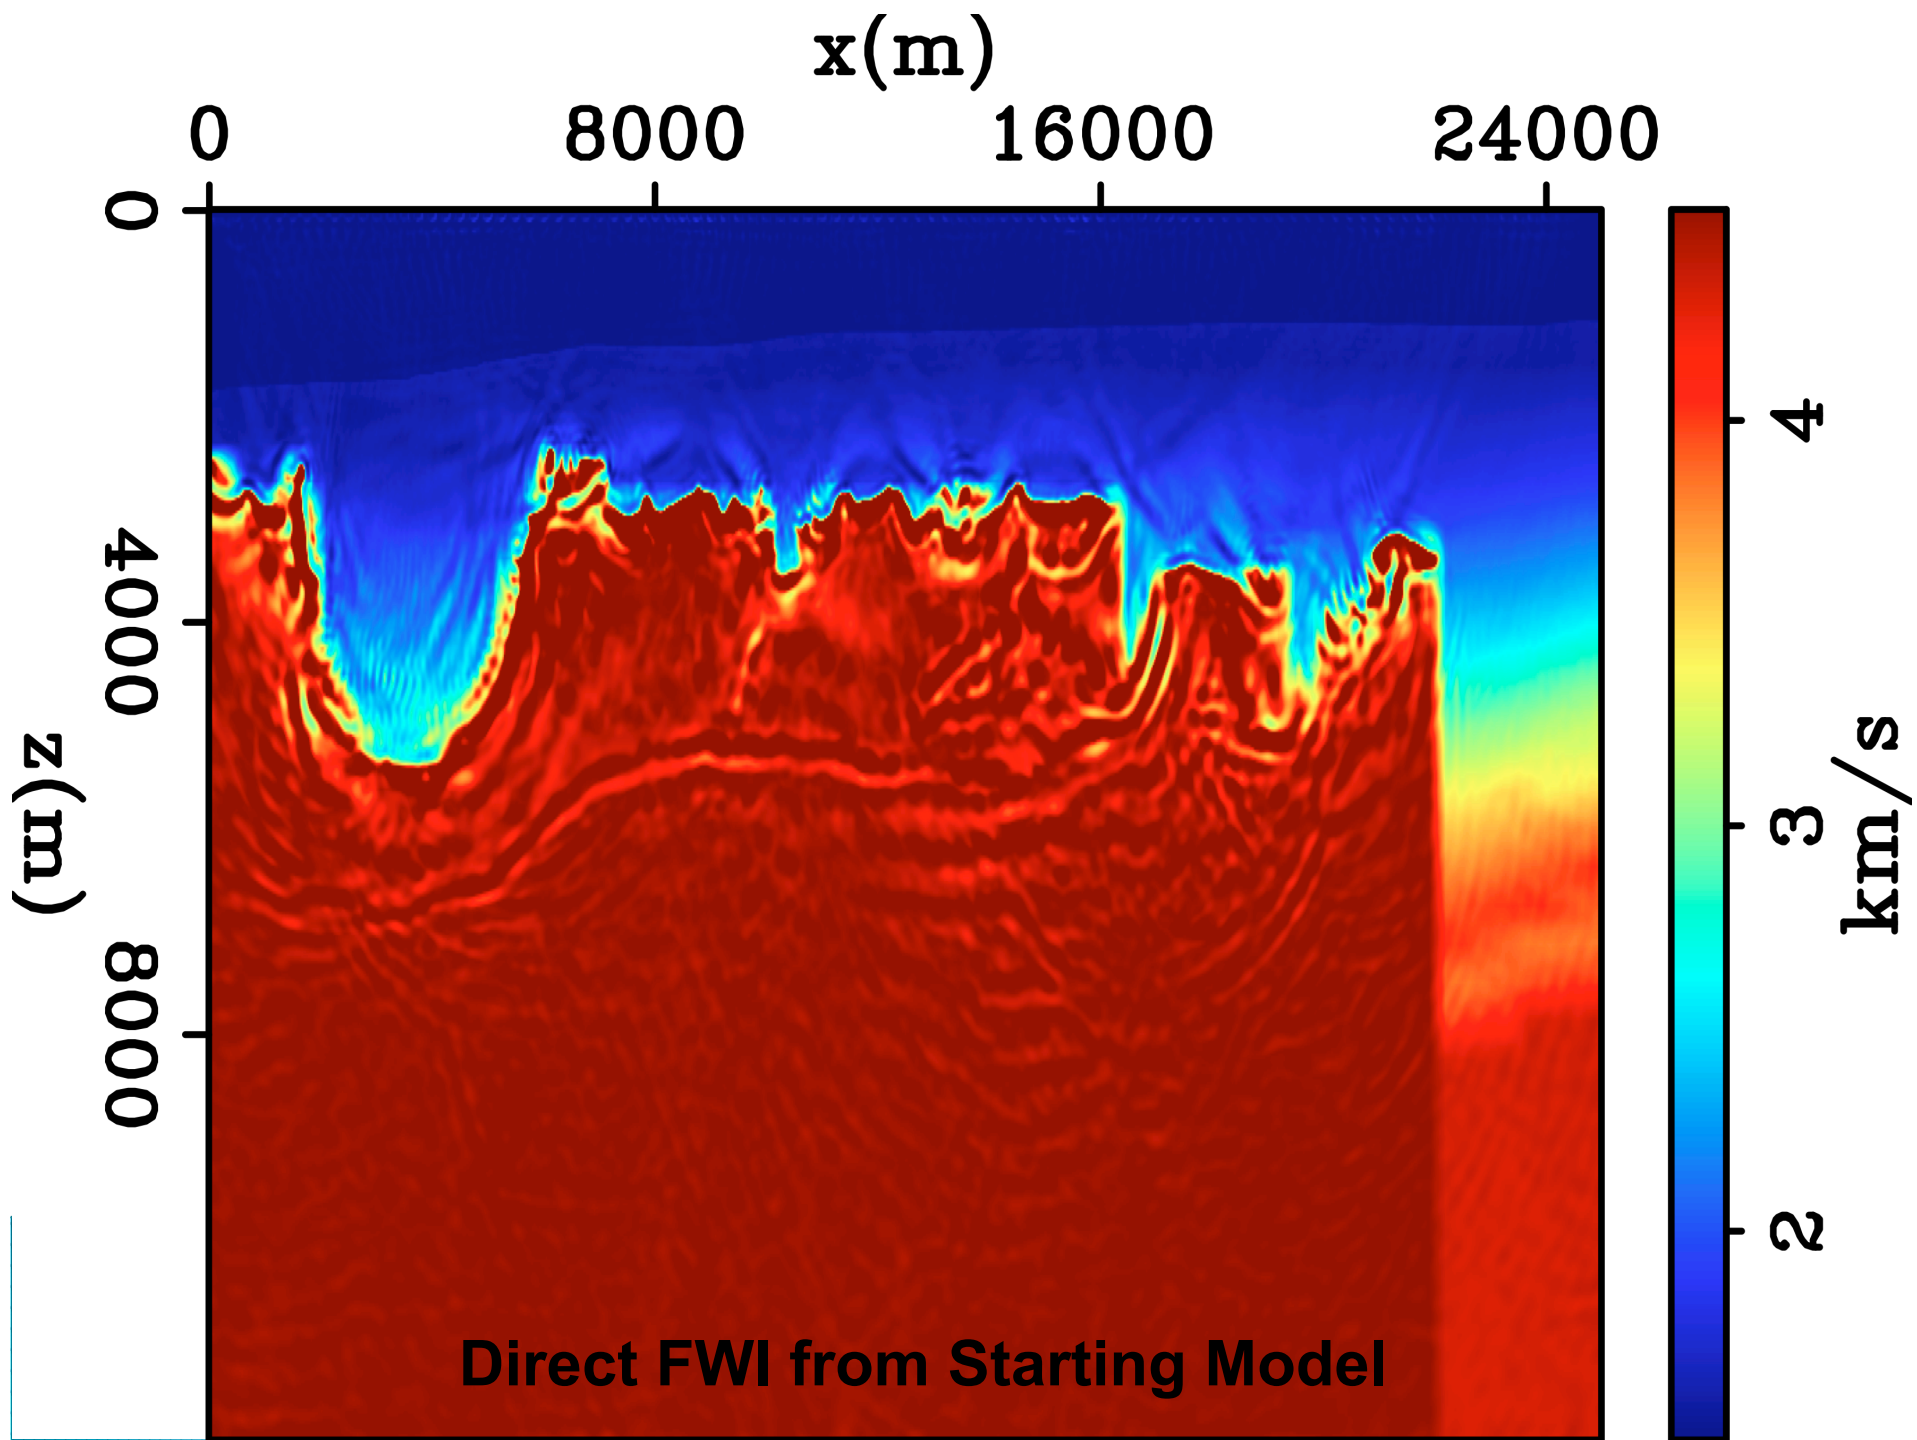

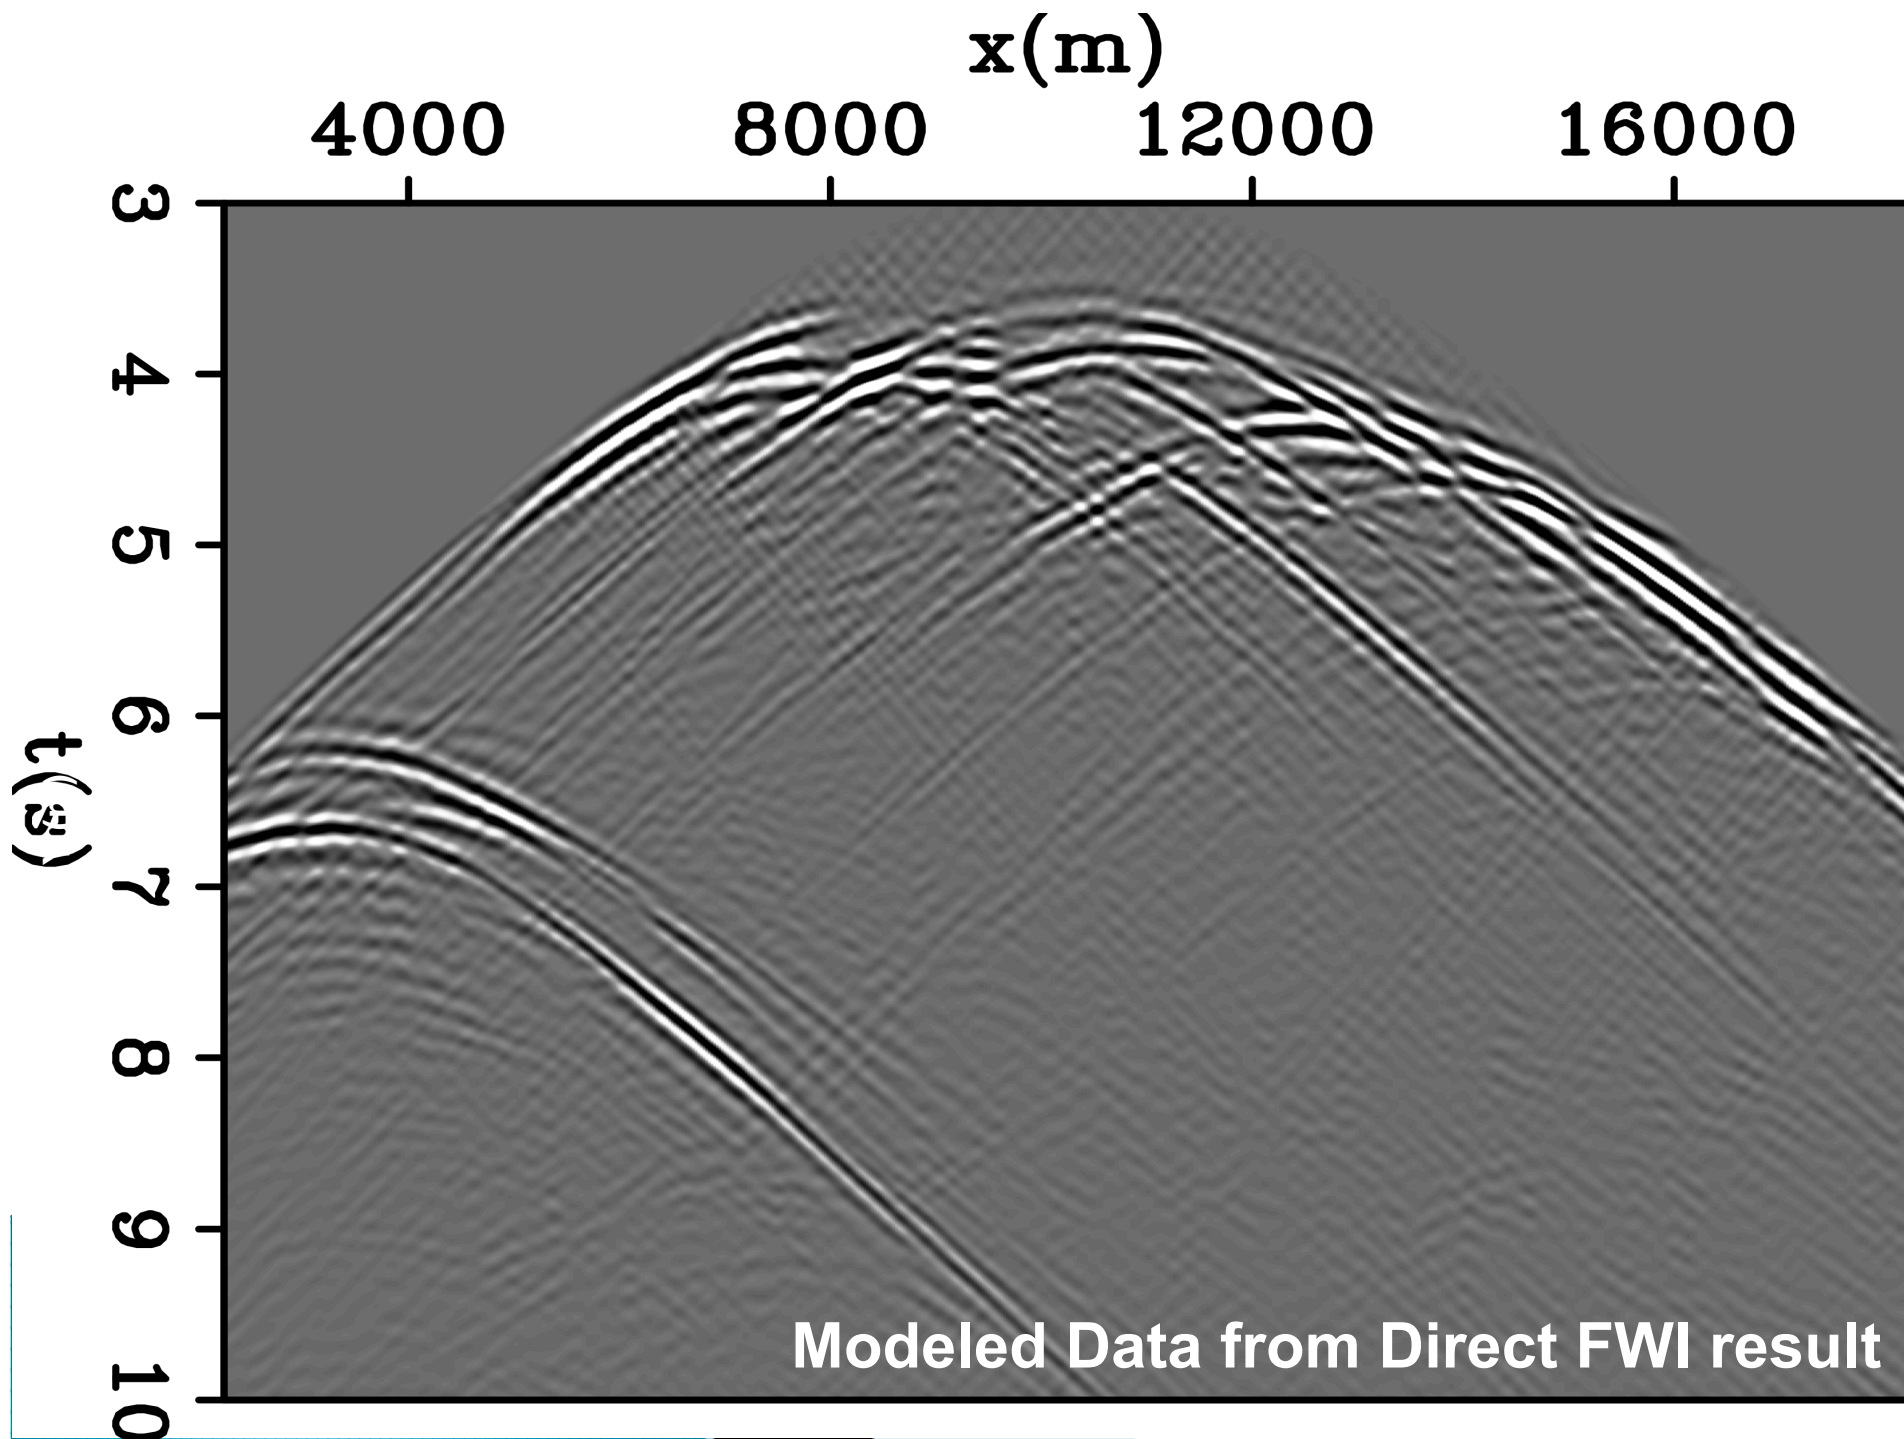

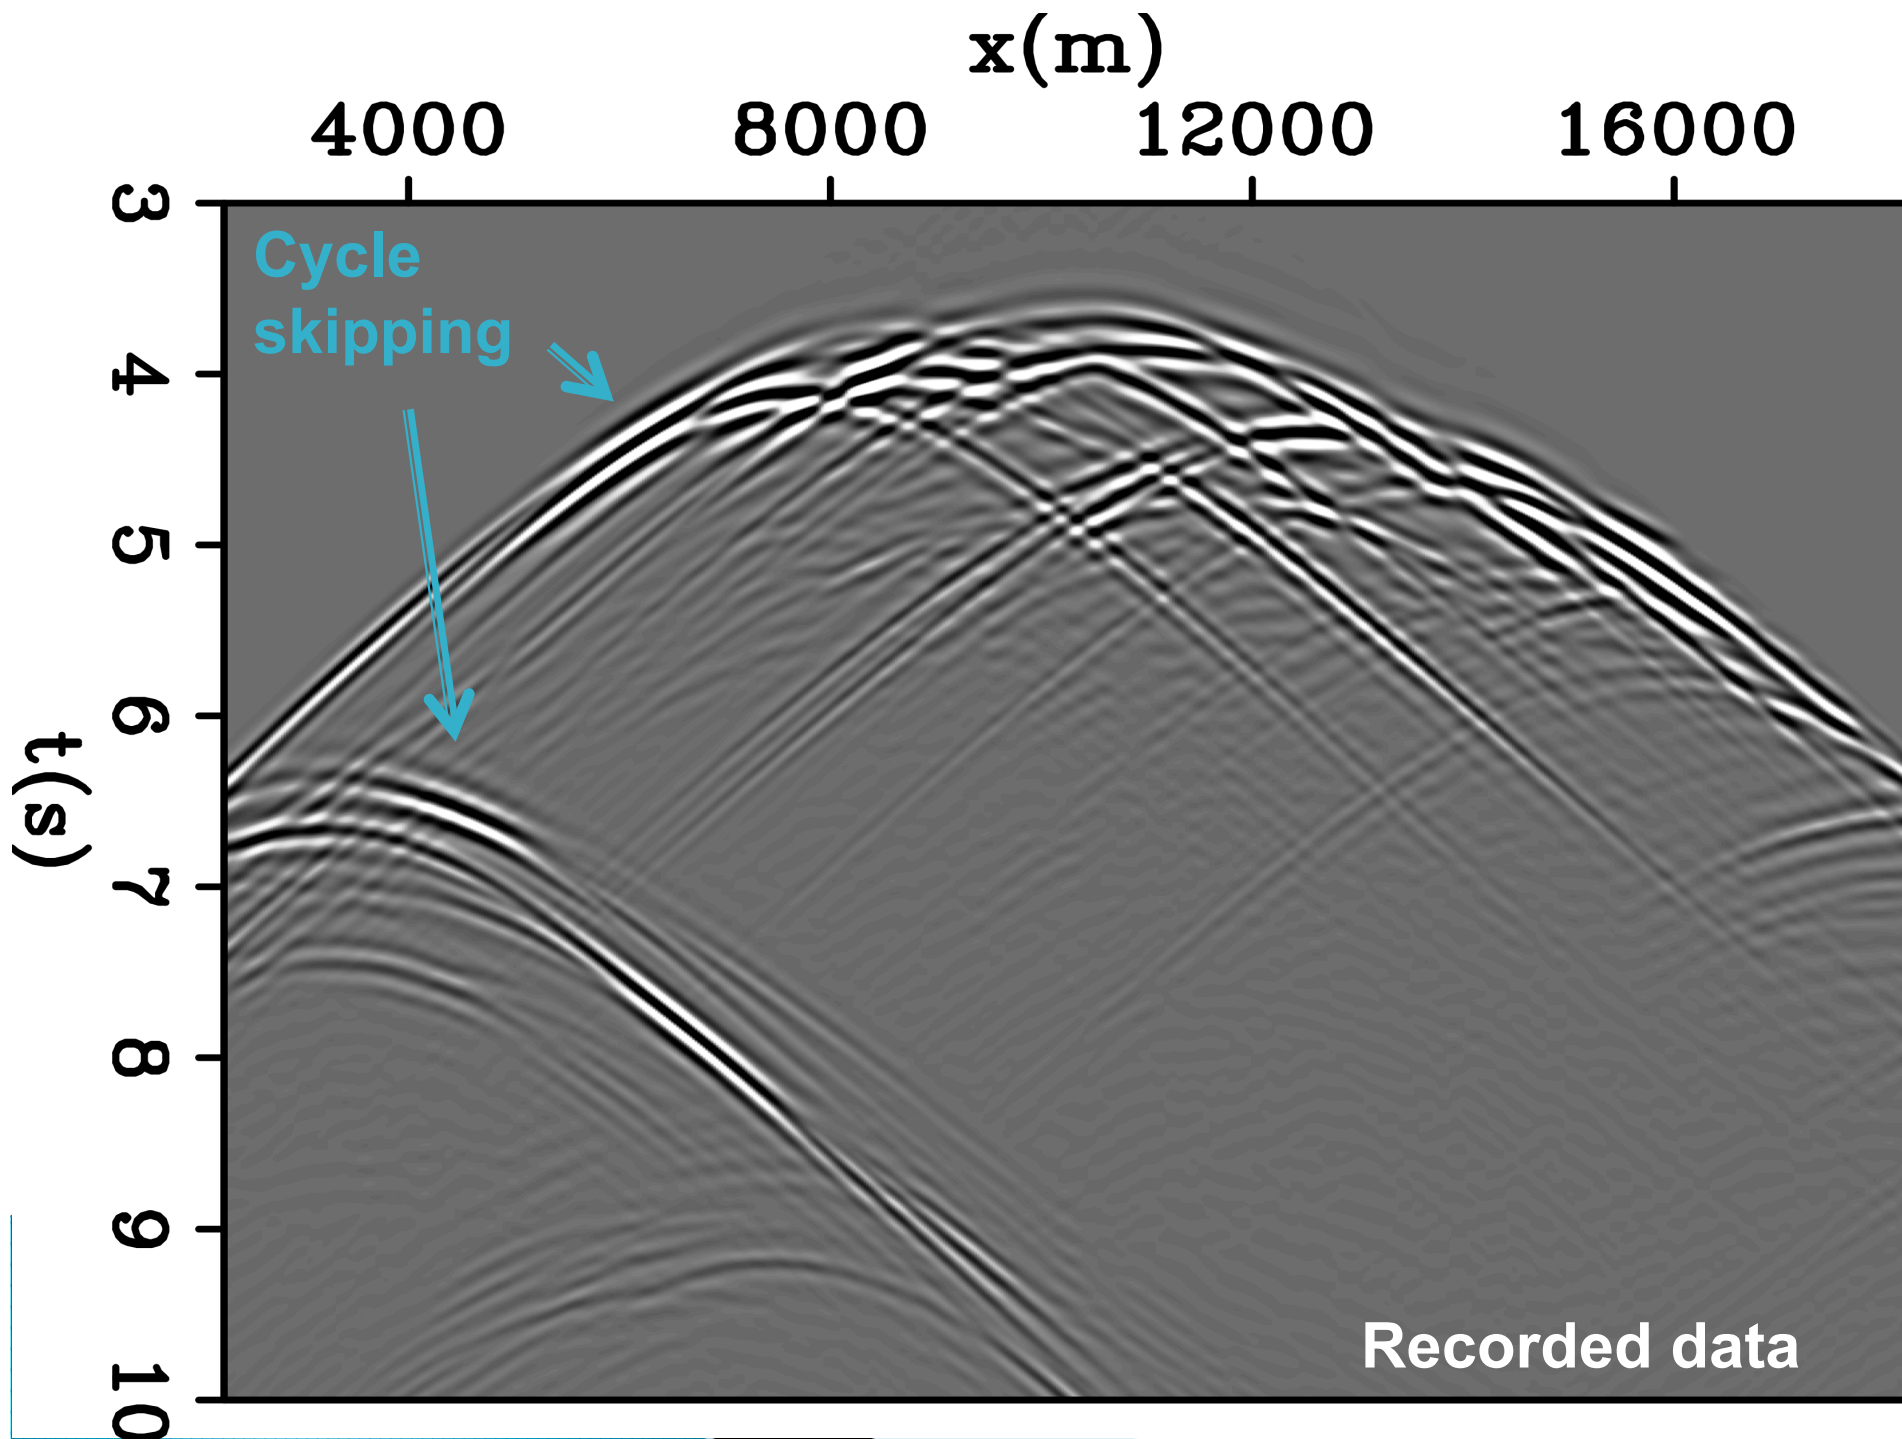

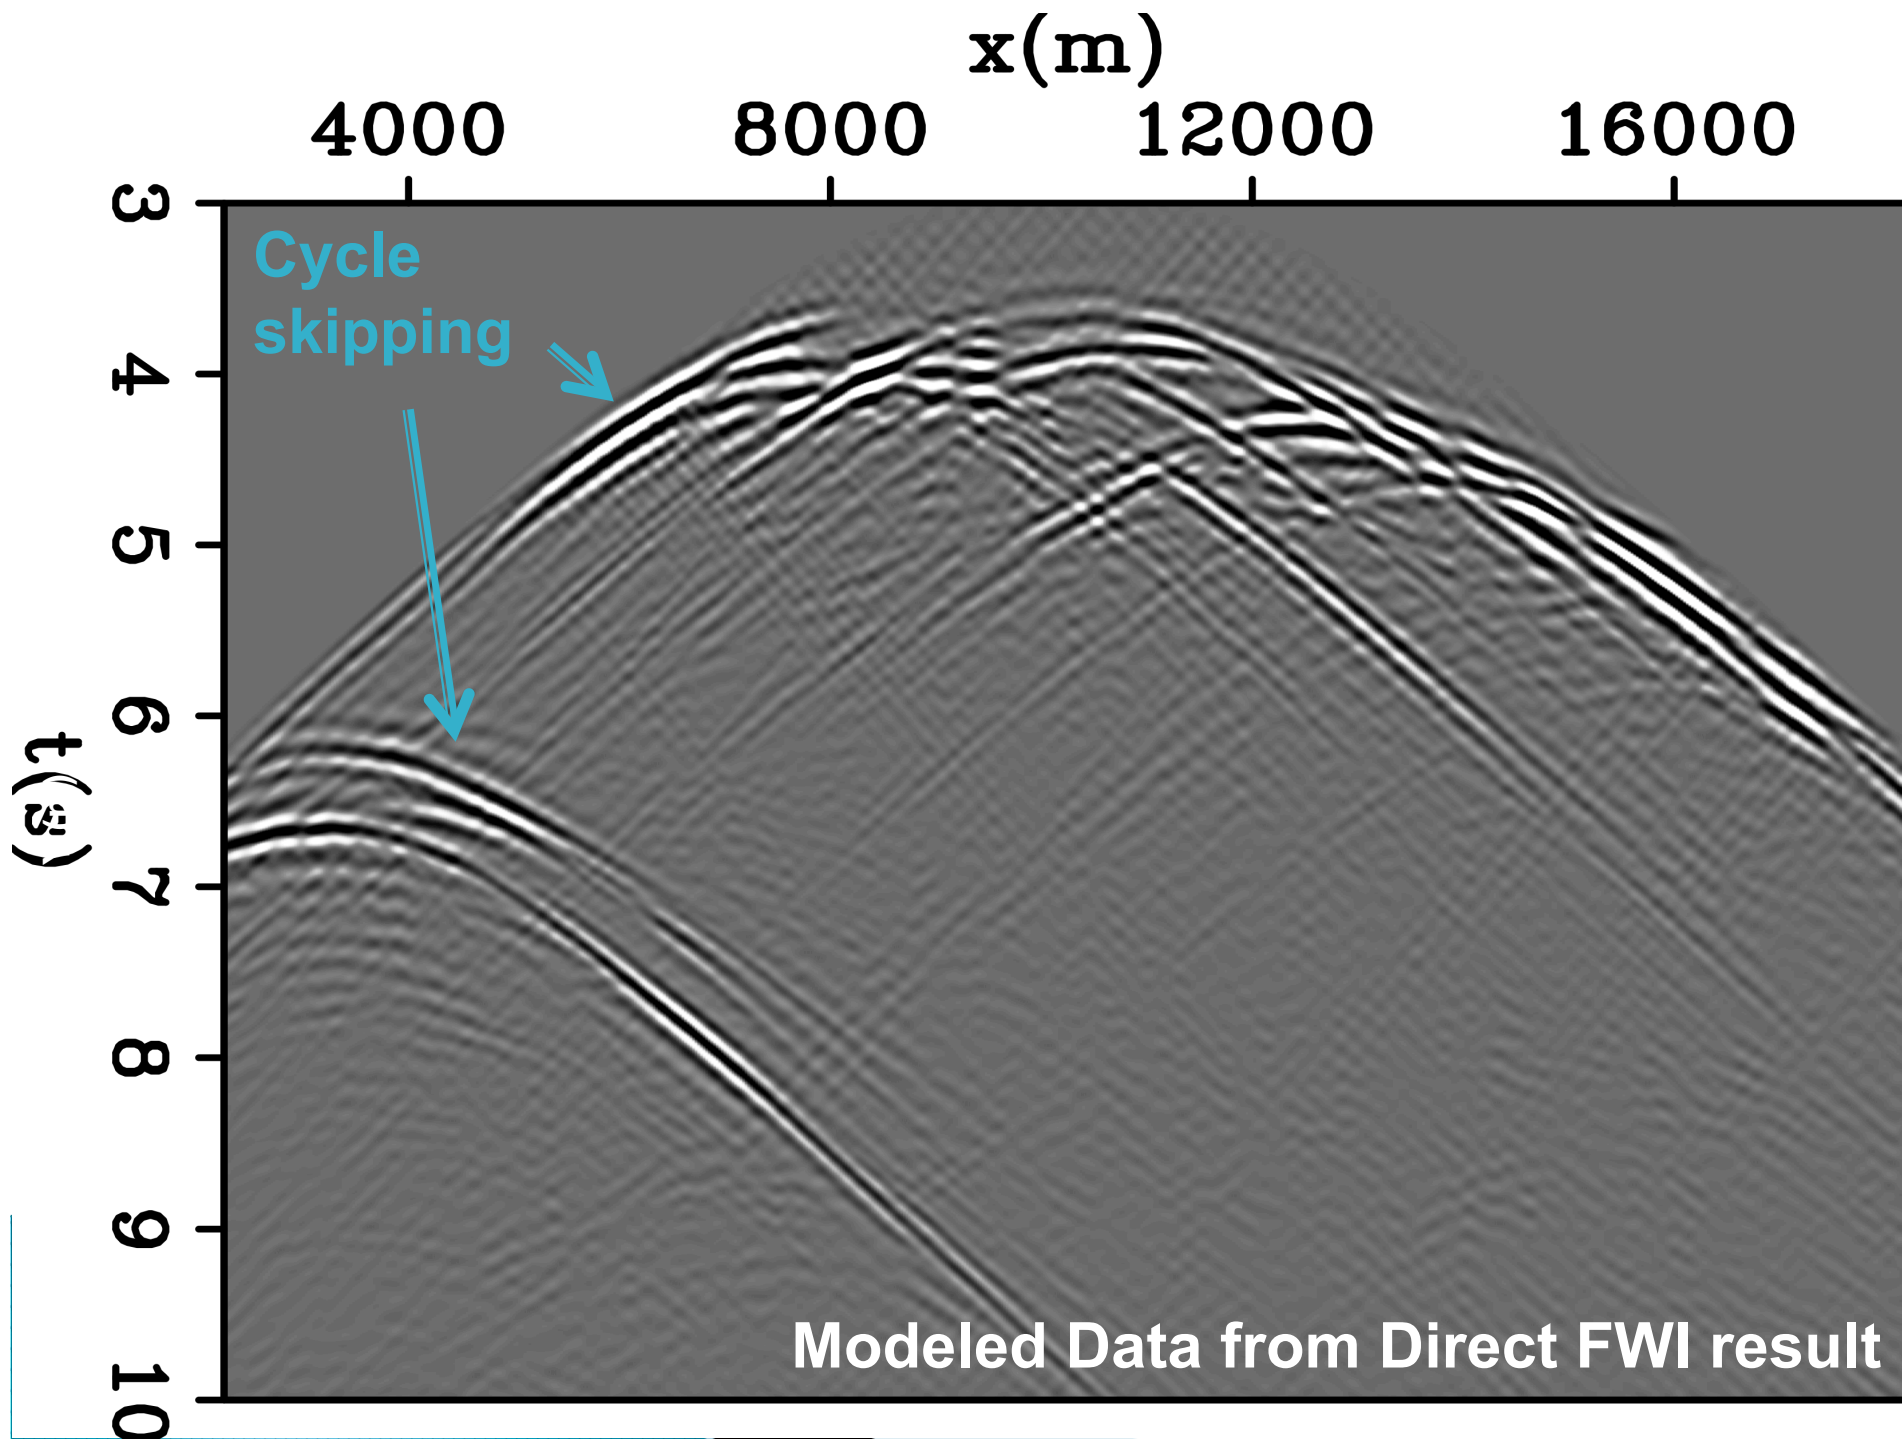

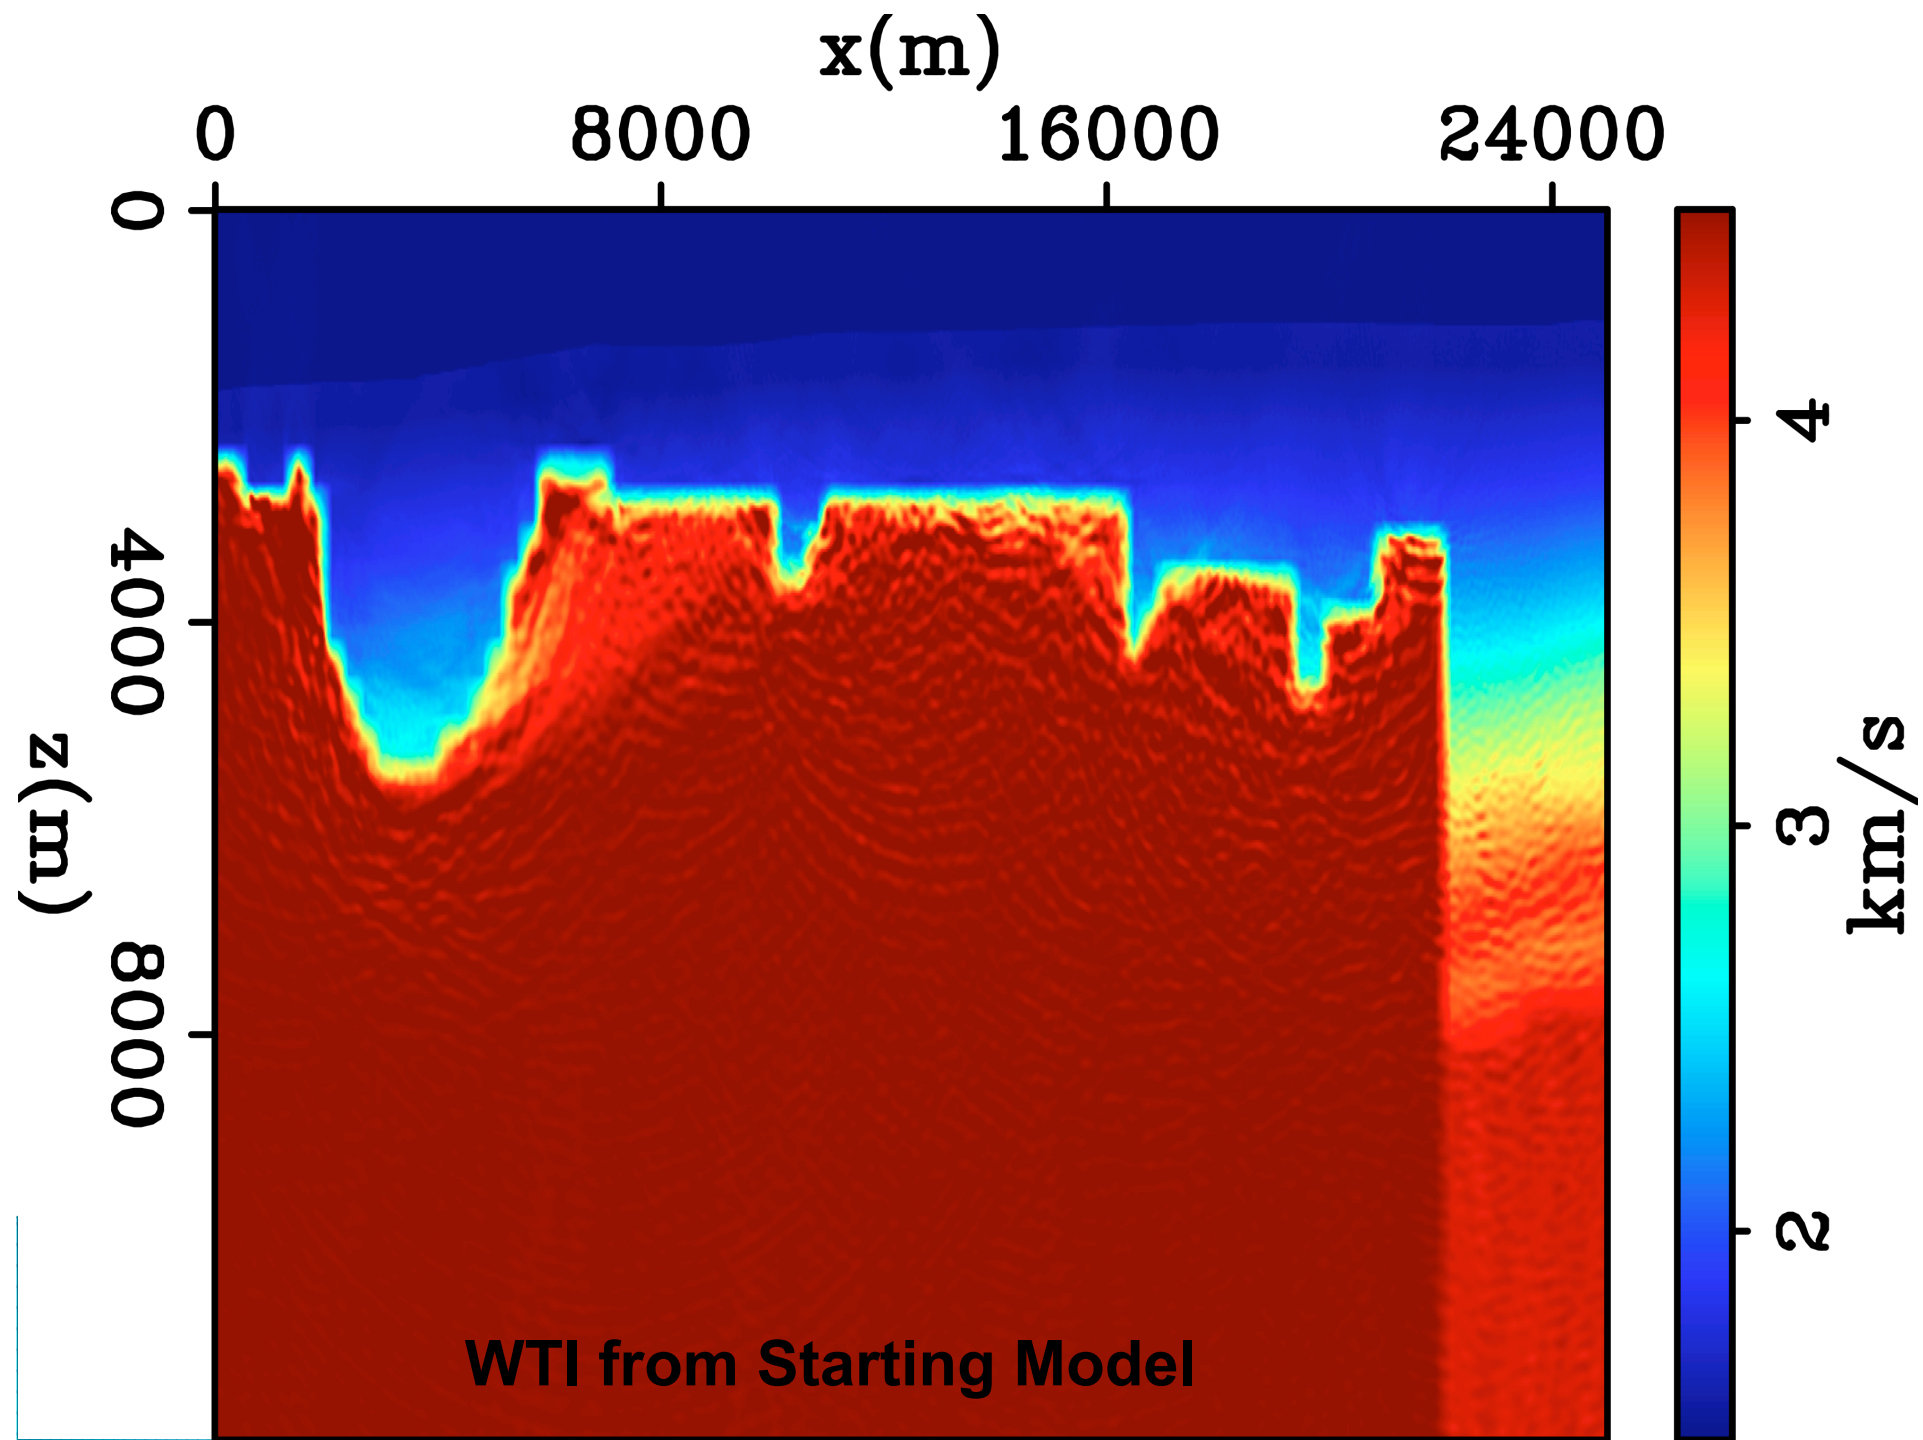

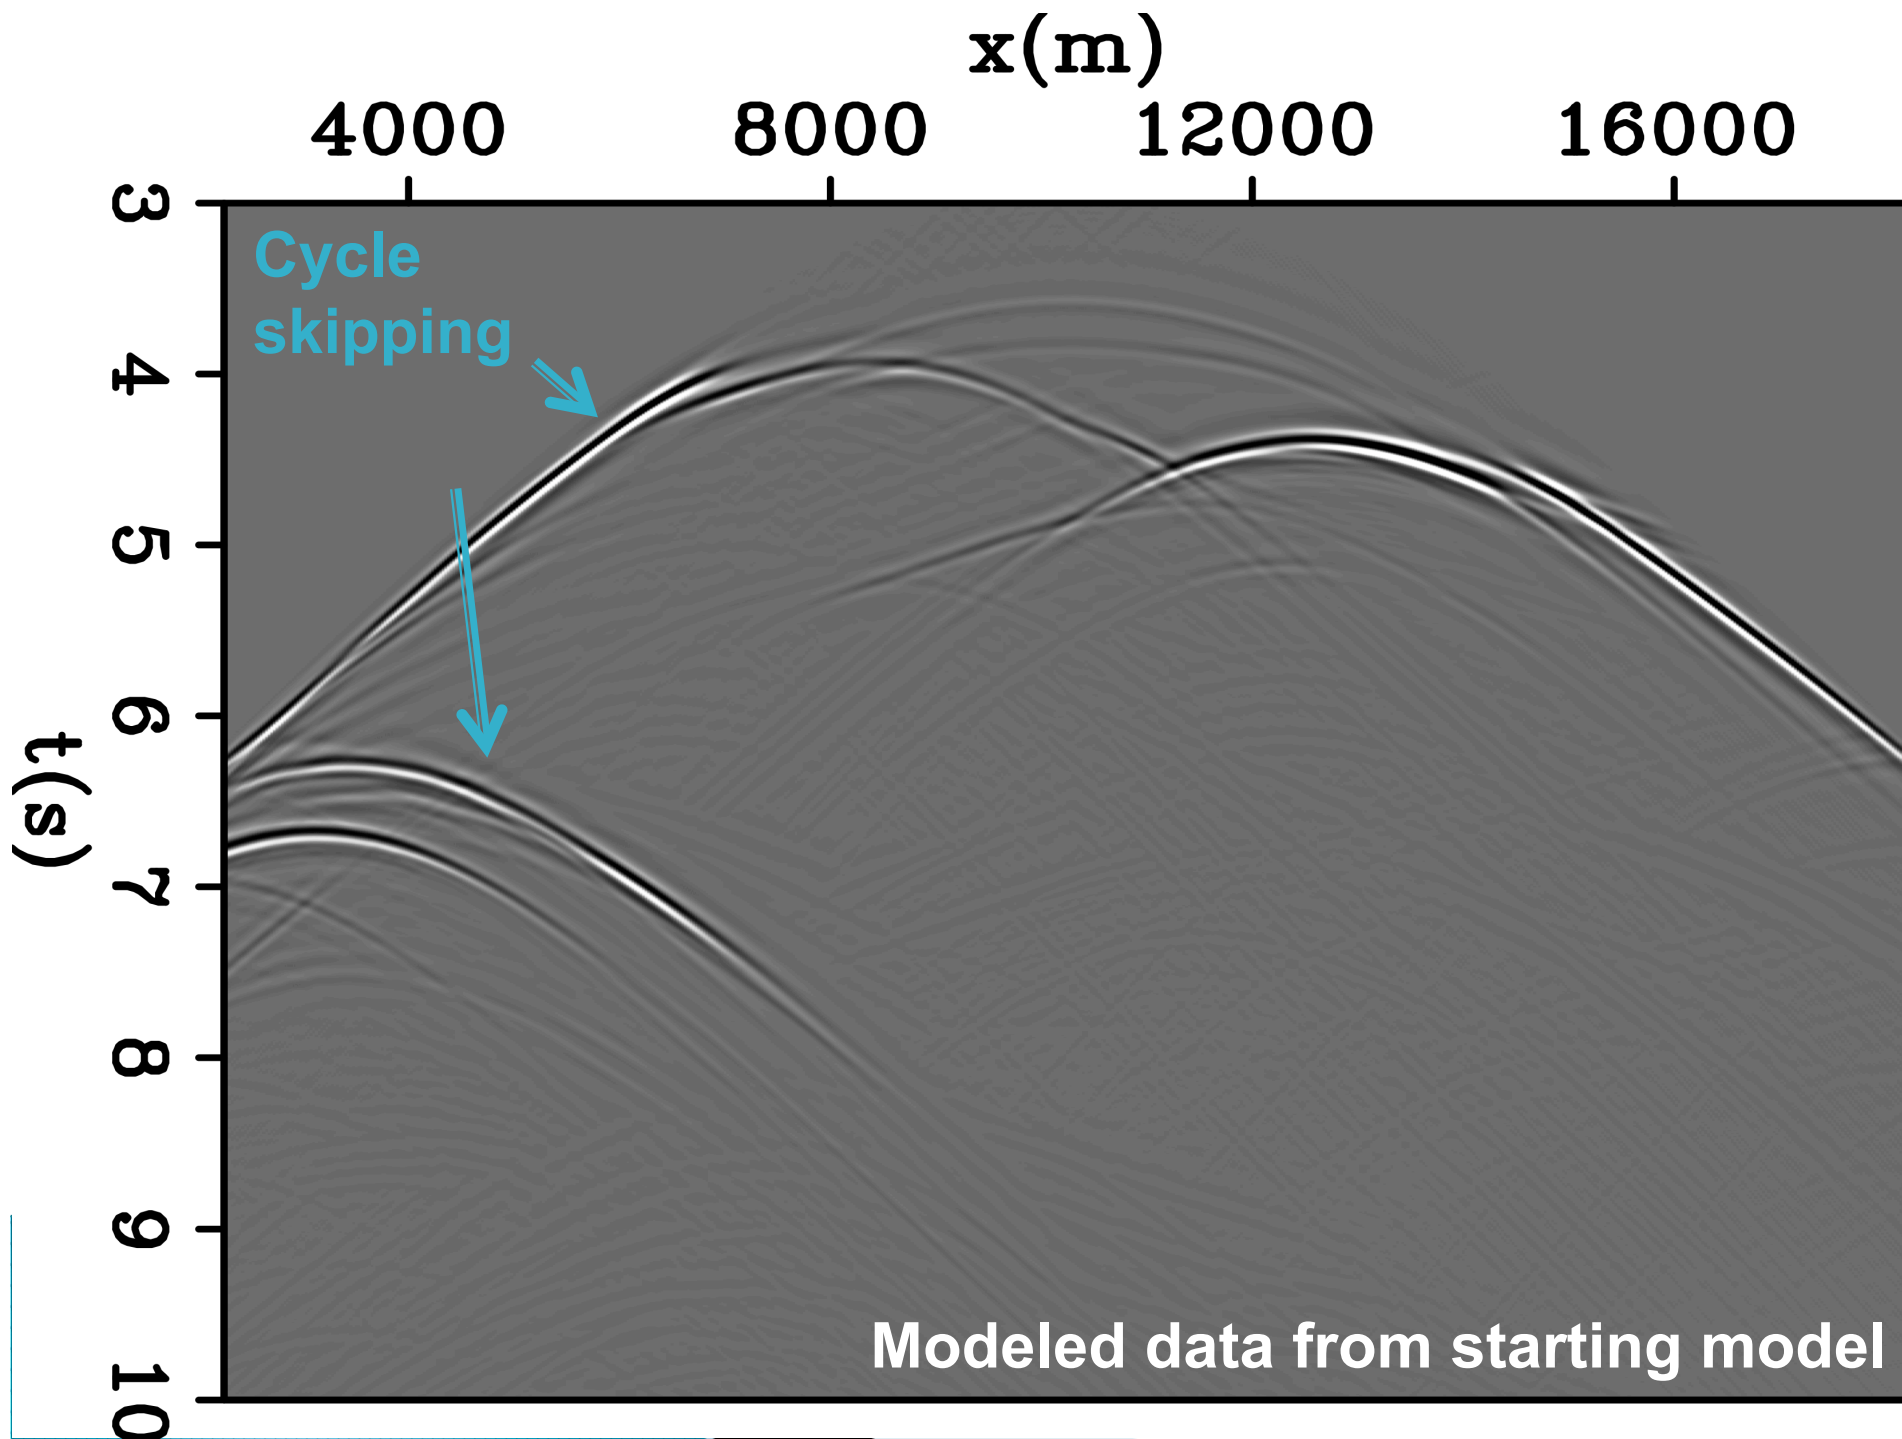

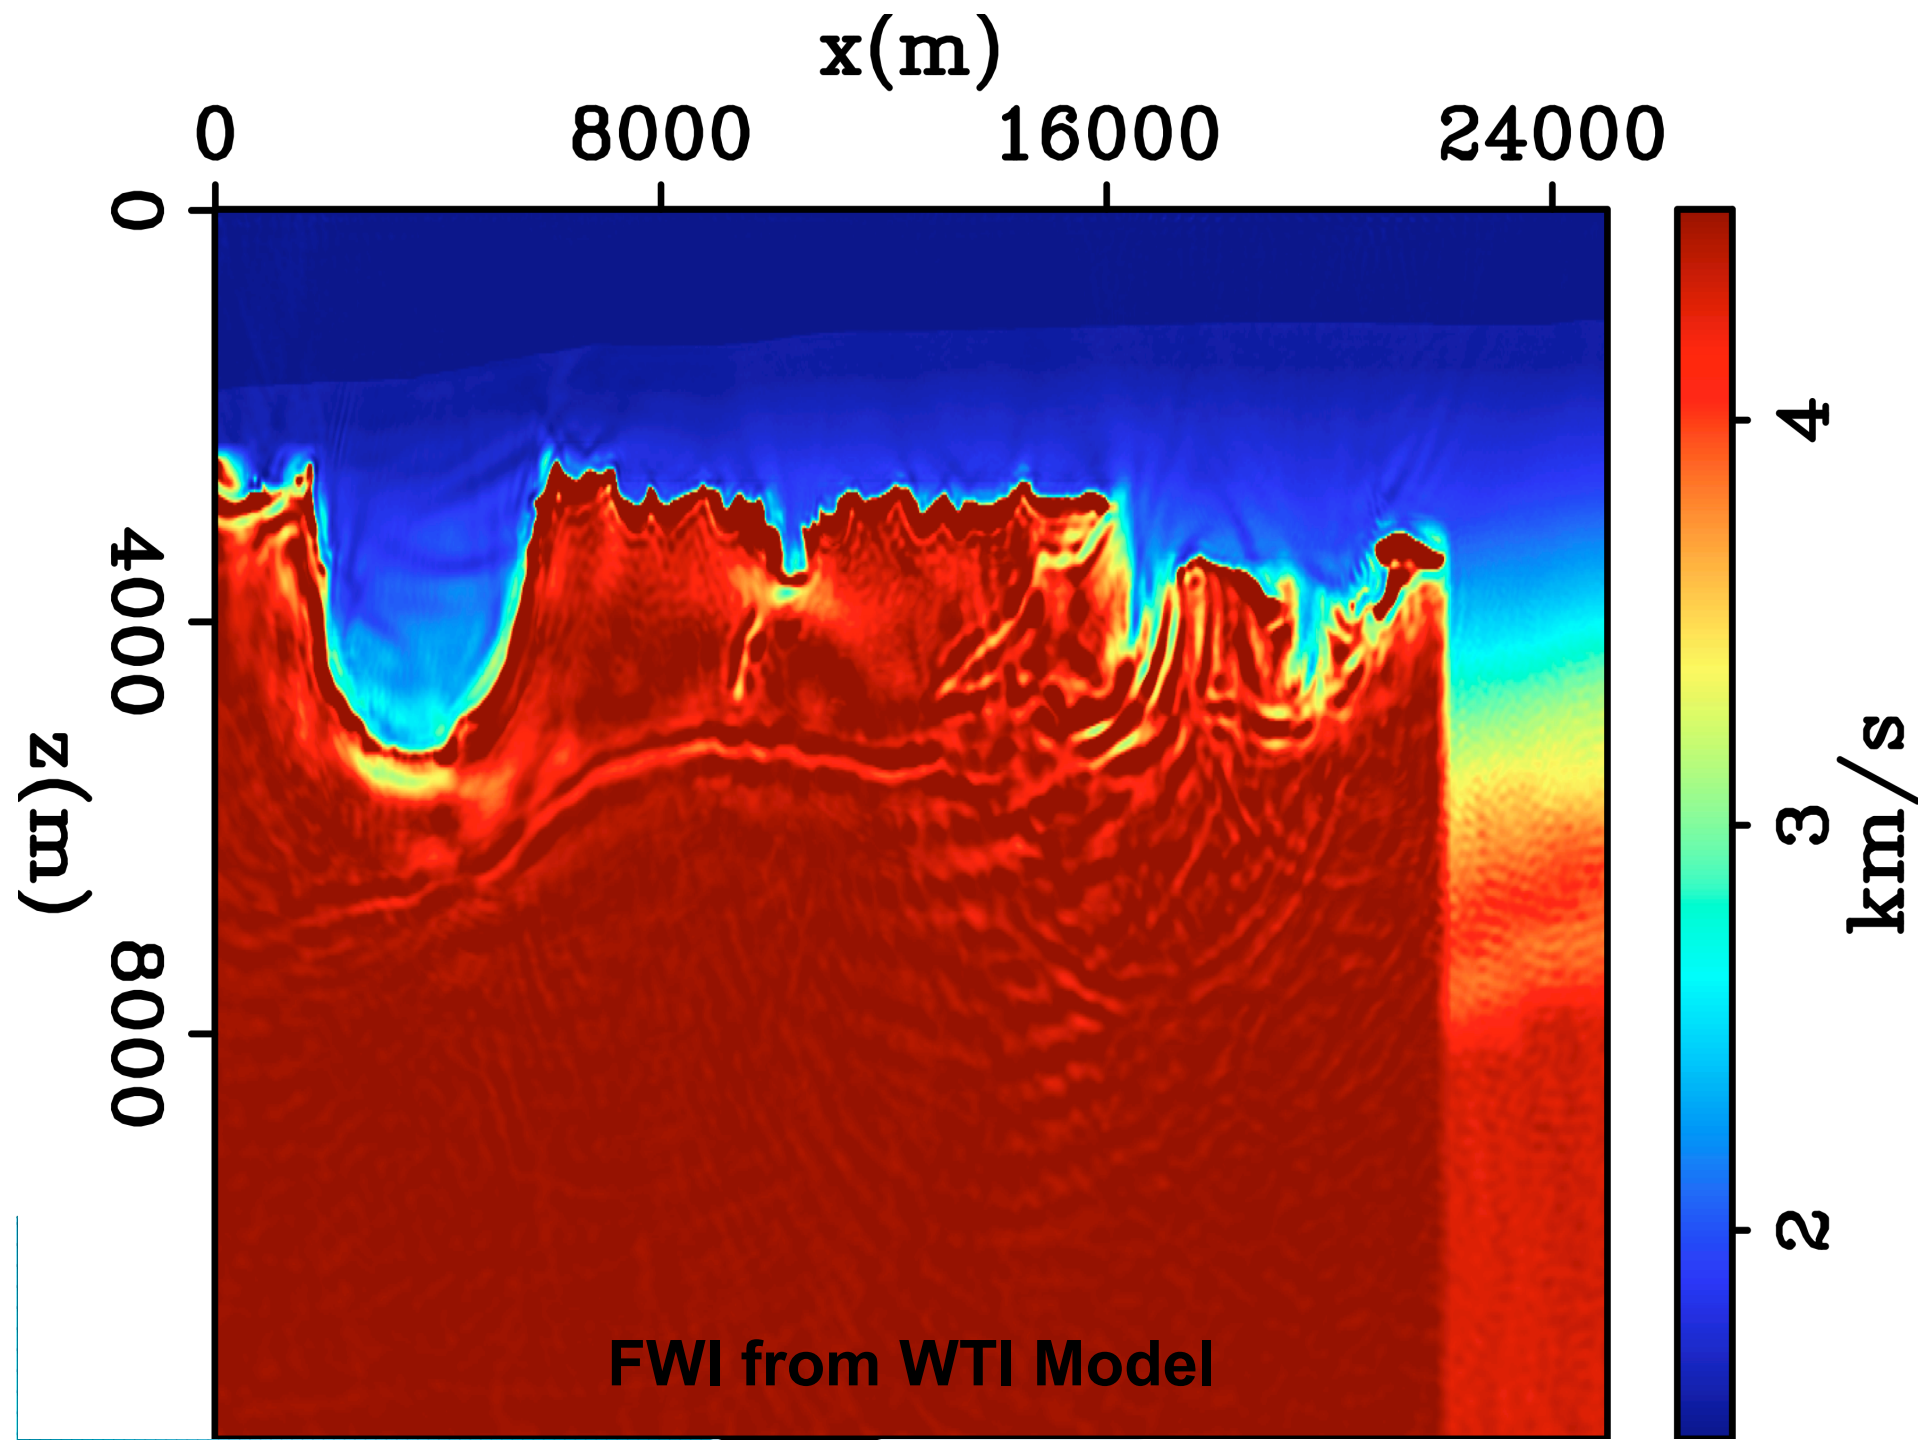

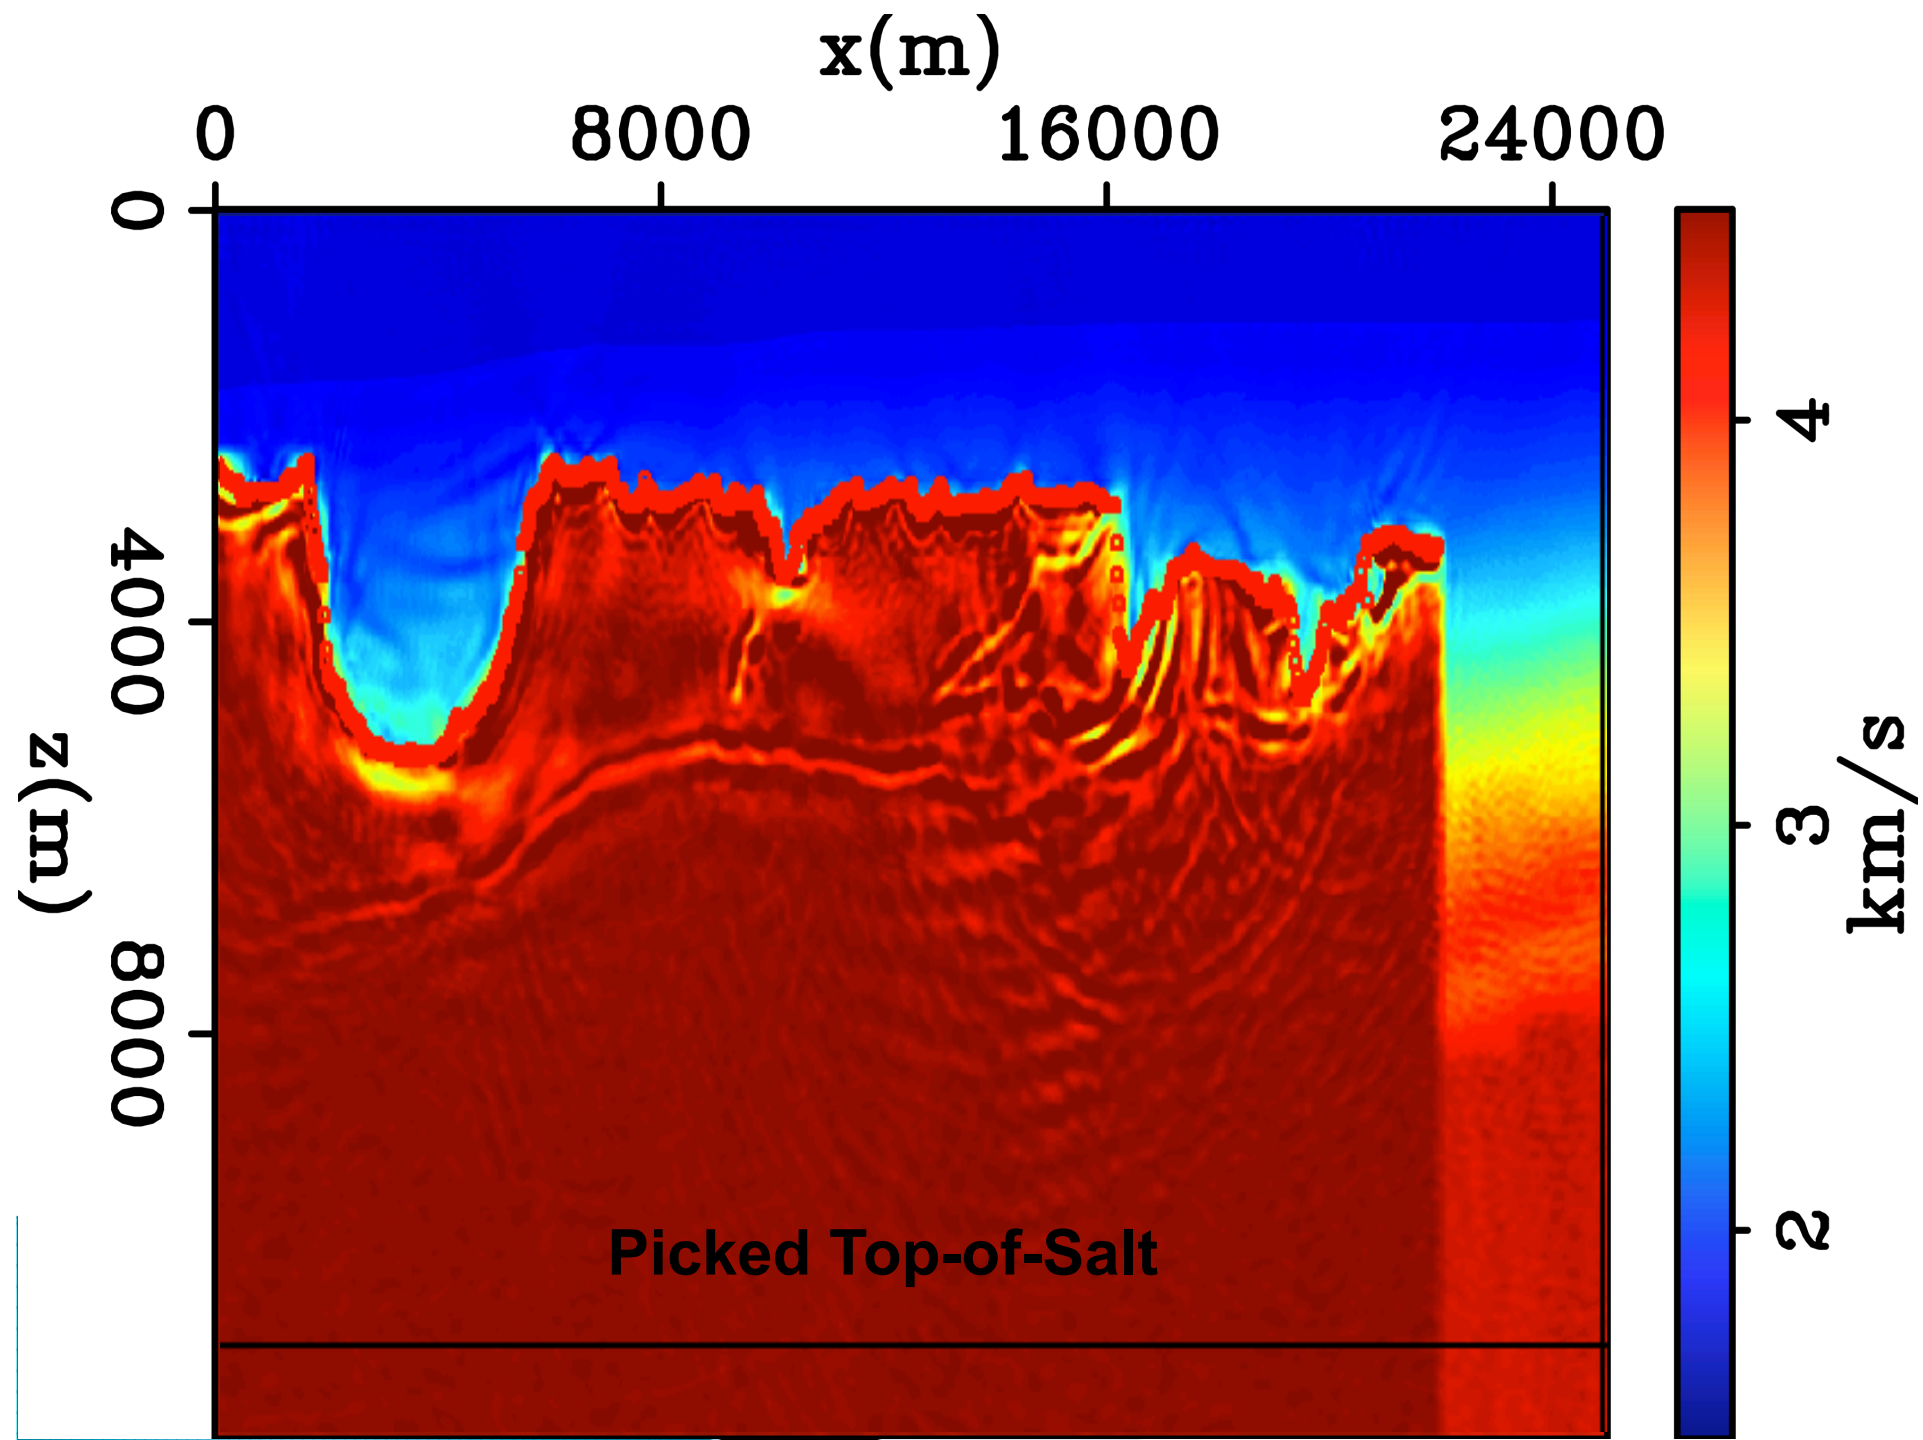

Comparison with WTI using original term

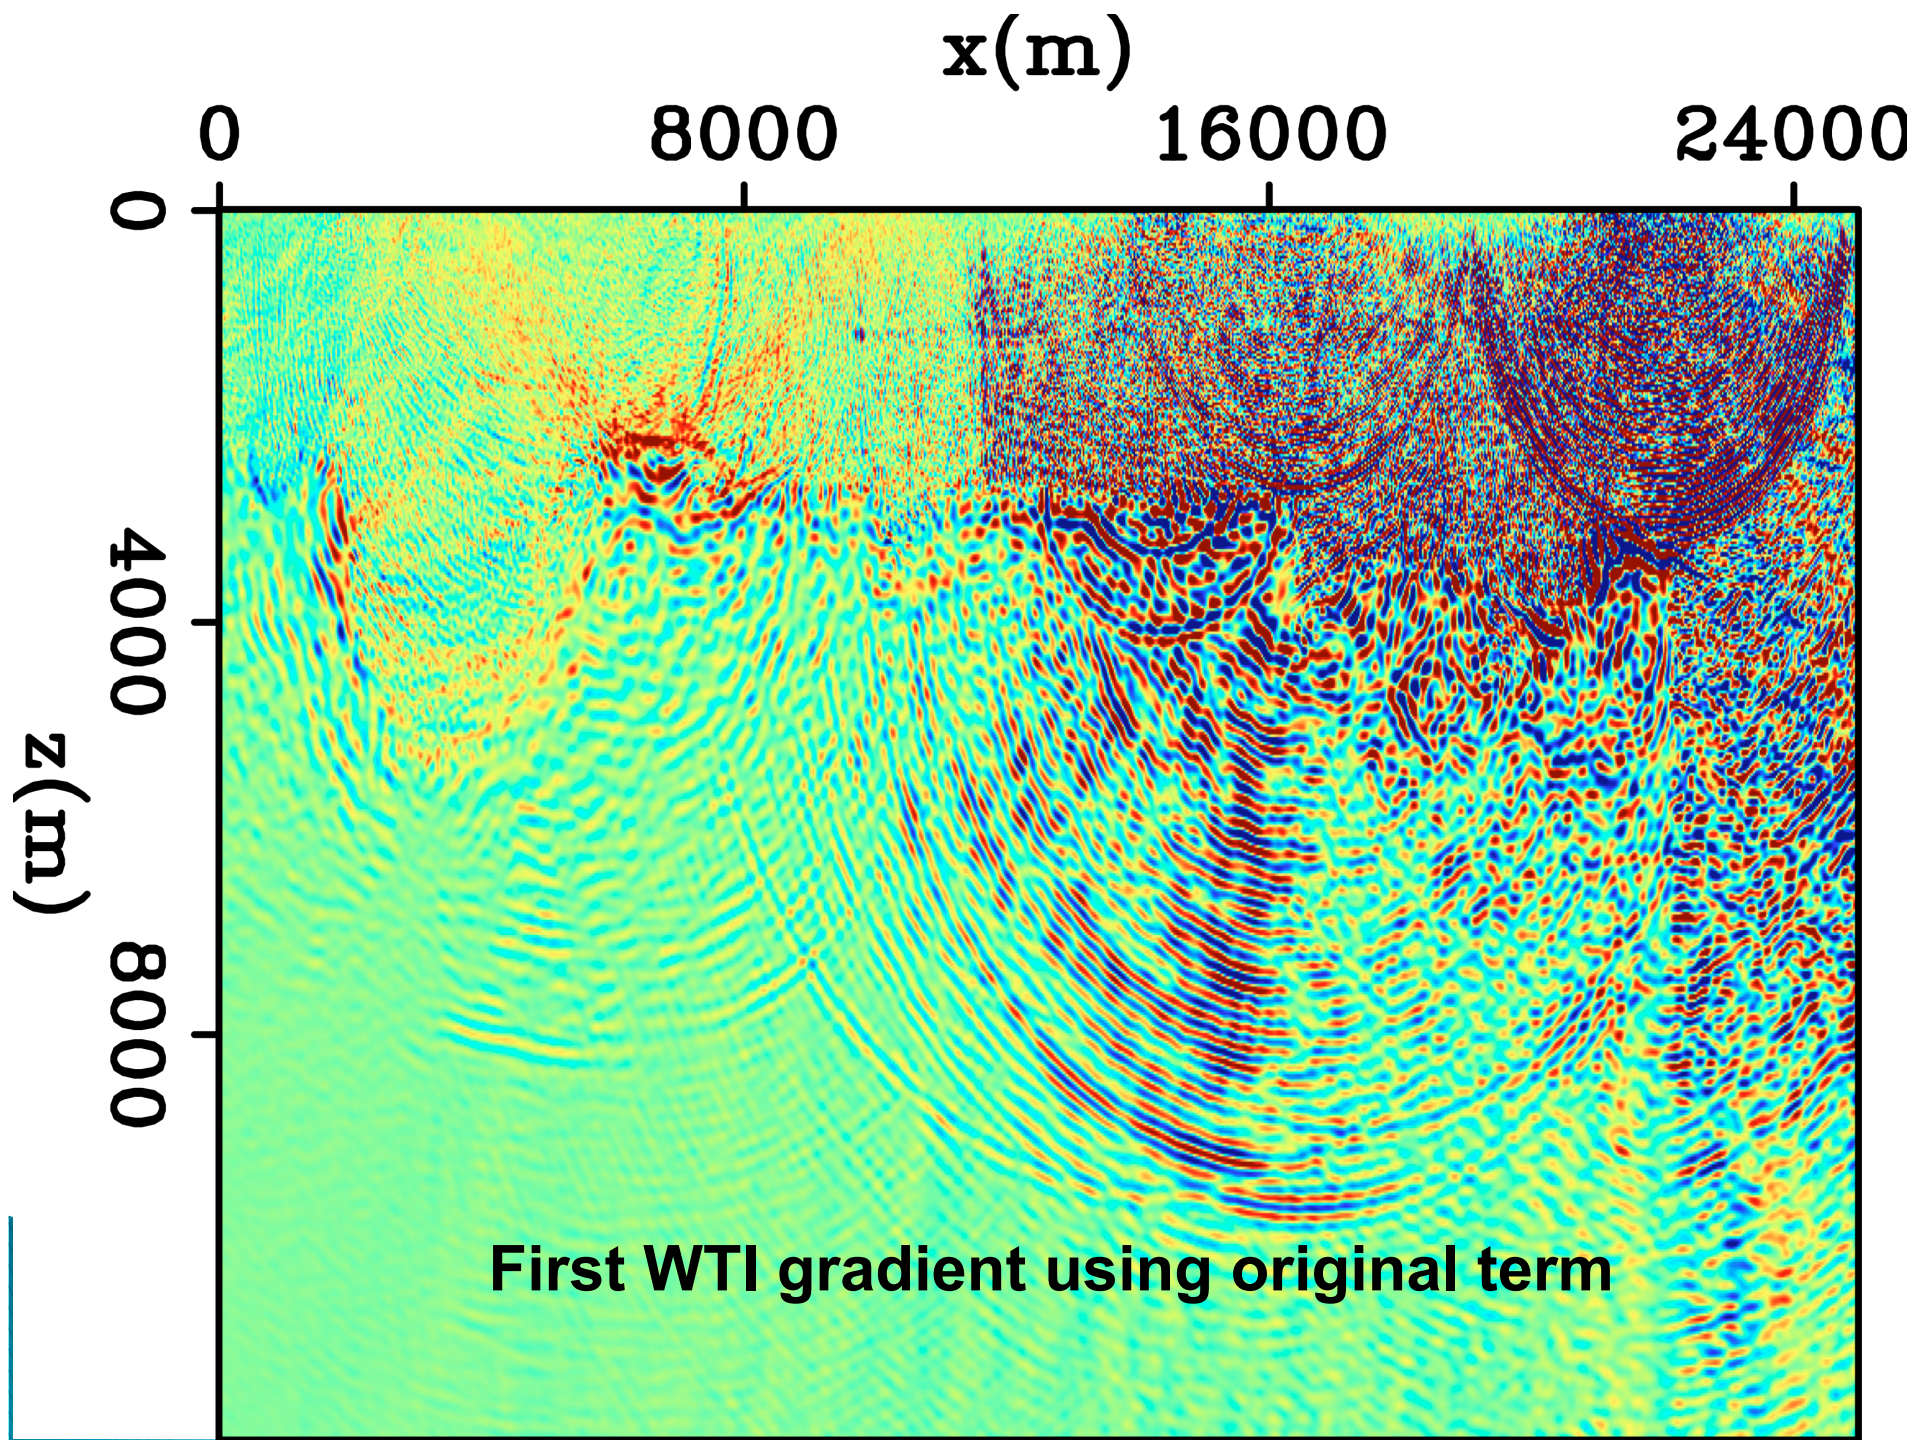

Original:

$$\delta d_{vsrc} = \Delta \tau \frac{\dot{d}_{obs}(t + \Delta \tau)}{\dot{d}_{obs}(t + \Delta \tau) * \dot{d}_{cal}(t)}$$

New:

$$\delta d'_{vsrc} = \Delta \tau \frac{\dot{d}_{cal}(t)}{\dot{d}_{cal}(t) * \dot{d}_{cal}(t)}$$

Conclusion

Proposed modification:

- 1. Makes trouble shooting easier than original formulation.**

Conclusion

Proposed modification:

- 1. Makes trouble shooting easier than original formulation.**
- 2. Has a very clear analogy to ray based method.**

Conclusion

Proposed modification:

- 1. Makes trouble shooting easier than original formulation.**
- 2. Has a very clear analogy to ray based method.**
- 3. More tolerant of errors in traveltime difference picks.**

Conclusion

Proposed modification:

- 1. Makes trouble shooting easier than original formulation.**
- 2. Has a very clear analogy to ray based method.**
- 3. More tolerant of errors in traveltime difference picks.**
- 4. Helps improving salt estimation significantly.**
