

SOHO/MDI solar oscillations

*James Rickett*¹

ABSTRACT

The dataset consists of a cube of raw velocity data from the Michelson Doppler Imager (MDI) instrument aboard the SOHO satellite. The data have been transformed to Cartesian coordinates by projecting high-resolution data from an area approximately 18° square onto a tangent plane. The object in the center of the time-slice (top of cube) is a sun-spot. The sampling spacing is 1 minute on the time-axis and approximately 825 km on the two spatial axes.

SOHO/MDI SOLAR OSCILLATIONS

Raw Data /net/kana/data/fun/solar/solar.HH

Velocity Model /net/kana/data/fun/solar/solarvel.HH

Usage Passive seismology (Rickett and Claerbout, 1999); Unsolved challenge: can you image the sides/bottom of the sunspot?? Try cross-correlation plus turning ray-migration.
